

FFT

Based on material in Section 5.4 of SciPy Lecture Notes (2015), <http://www.scipy-lectures.org/> (<http://www.scipy-lectures.org/>).

```
In [1]: import scipy as sp
        from scipy import fftpack

        import matplotlib as mpl      # As of July 2017 Bucknell computers use v. 2.x
        import matplotlib.pyplot as plt

        # Following is an Ipython magic command that puts figures in the notebook.
        # For figures in separate windows, comment out following line and uncomment
        # the next line
        # Must come before defaults are changed.
        %matplotlib notebook
        #matplotlib

        # As of Aug. 2017 reverting to 1.x defaults.
        # In 2.x text.ustex requires dvipng, texlive-latex-extra, and texlive-fonts-recommended
        # which don't seem to be universal
        # See https://stackoverflow.com/questions/38906356/error-running-matplotlib-in-latex-t
        mpl.style.use('classic')

        # M.L. modifications of matplotlib defaults using syntax of v.2.0
        # More info at http://matplotlib.org/2.0.0/users/deflt_style_changes.html
        # Changes can also be put in matplotlibrc file, or effected using mpl.rcParams[]
        plt.rc('figure', figsize = (6, 4.5))      # Reduces overall size of figures
        plt.rc('axes', labelsz=16, titlesz=14)
        plt.rc('figure', autolayout = True)      # Adjusts subplot parameters for new s.
```

Generate signal

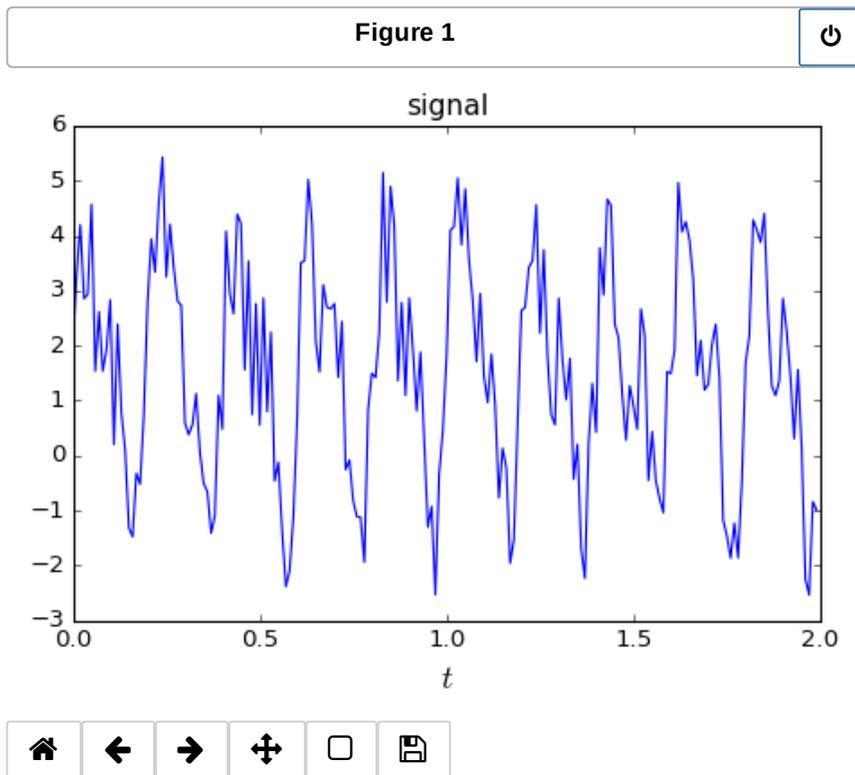

Signal is two superposed sine waves with noise.

```
In [2]: a1, a2 = 2, 1 # Amplitudes
        f1, f2 = 5, 10 # Frequencies
        tf = 2      # Final time
        dt = 0.01   # Time step

In [3]: t = sp.arange(0,tf,dt) # Signal samle times

In [4]: sig = a1*sp.sin(2.*sp.pi*f1*t) + a2*sp.sin(2.*sp.pi*f2*t)
        sig += 3*sp.random.random(len(t))
```

```
In [5]: plt.figure(1)
plt.title("signal", fontsize=14)
plt.xlabel("$t$")
plt.plot(t, sig)
```

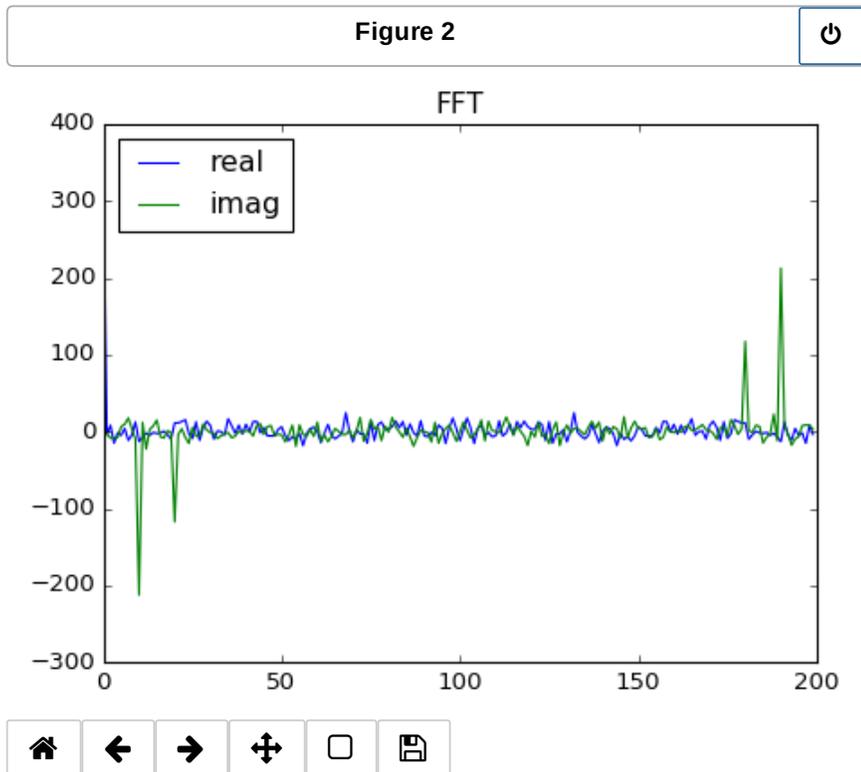

```
Out[5]: [<matplotlib.lines.Line2D at 0x7fd1ee4e90b8>]
```

Calculate FFT

```
In [6]: sample_freq = sp.fftpack.fftfreq(len(sig), d=dt) # Frequency values (+, -)
sig_fft = sp.fftpack.fft(sig) # Calculate FFT
```

- Display real and imaginary parts of FFT.
- 0 is in center
- Symmetric about 0

```
In [7]: plt.figure(2)
plt.title("FFT", fontsize=14)
plt.plot(sig_fft.real, label='real')
plt.plot(sig_fft.imag, label='imag')
plt.legend(loc=2)
```

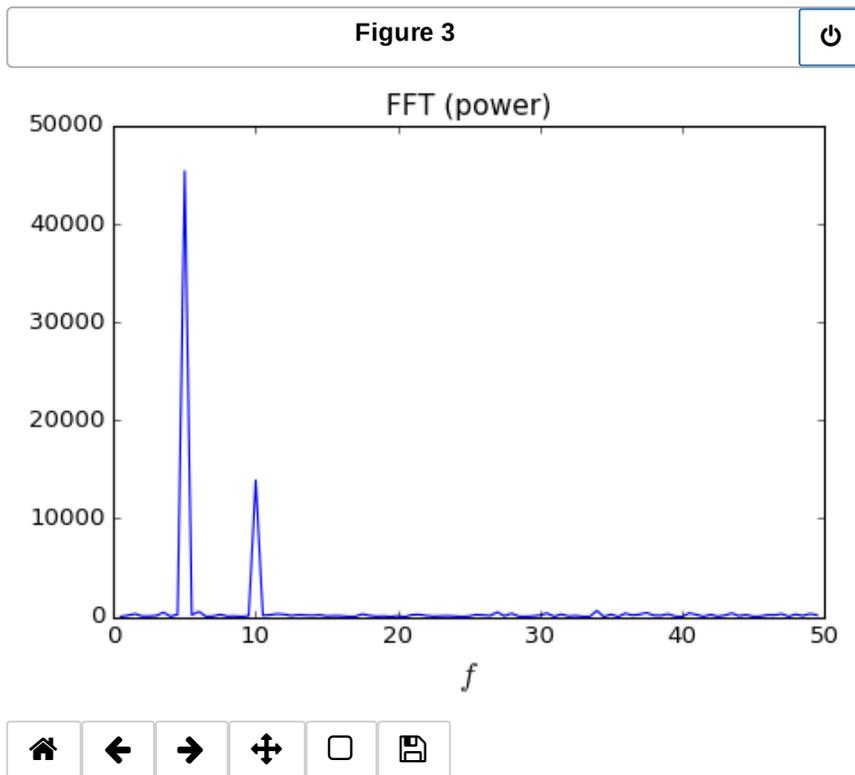

Out[7]: <matplotlib.legend.Legend at 0x7fd1ee45edd8>

Calculate and plot power spectrum for $f > 0$.

```
In [8]: pfs = sp.where(sample_freq>0) # Select positive frequencies
freqs = sample_freq[pfs]
power = abs(sig_fft)[pfs]**2
```

```
In [9]: plt.figure(3)
plt.title("FFT (power)", fontsize=14)
plt.xlabel("$f$")
plt.plot(freqs, power)
```

```
Out[9]: [<matplotlib.lines.Line2D at 0x7fd1ee497400>]
```

Filter and inverse transform

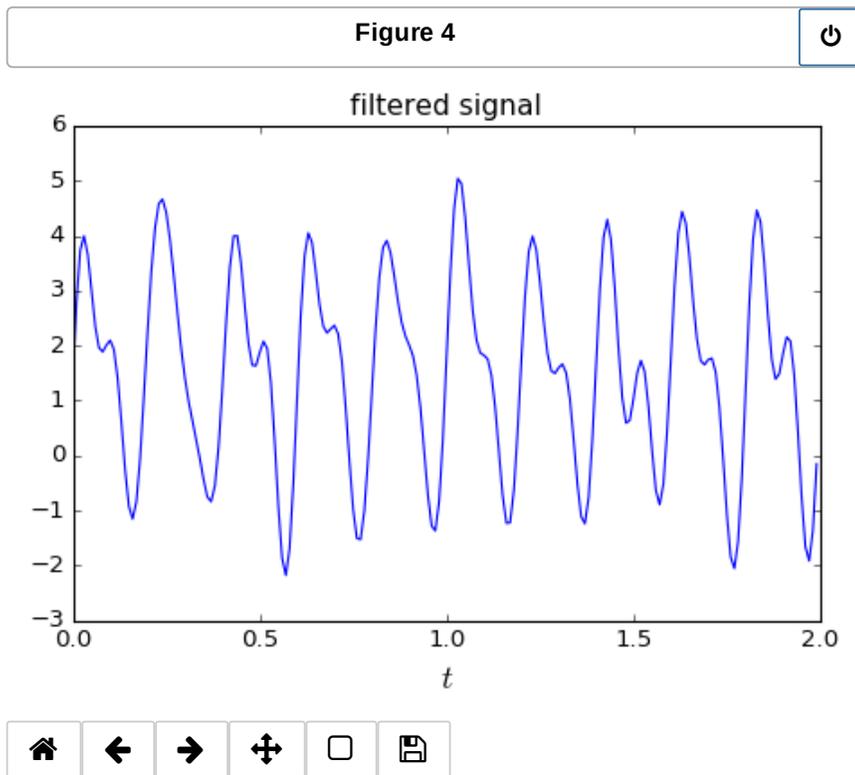

Crude low-pass filter: cut out all frequencies greater than 12.

```
In [10]: sig_fft[abs(sample_freq) > 12] = 0
```

Calculate inverse FFT:

```
In [11]: sig_filtered = sp.fftpack.ifft(sig_fft)
```

```
In [12]: plt.figure(4)
plt.title("filtered signal", fontsize=14)
plt.xlabel("$t$")
plt.plot(t, sp.real(sig_filtered));
```

Version information

version_information from J.R. Johansson (jrjohansson at gmail.com) See Introduction to scientific computing with Python <http://nbviewer.jupyter.org/github/jrjohansson/scientific-python-lectures/blob/master/Lecture-0-Scientific-Computing-with-Python.ipynb> (<http://nbviewer.jupyter.org/github/jrjohansson/scientific-python-lectures/blob/master/Lecture-0-Scientific-Computing-with-Python.ipynb>) If version_information has been installed, continue with the next cell. If not, do a one-time install it with pip install --upgrade version_information, OR %install_ext http://raw.githubusercontent.com/jrjohansson/version_information/master/version_information.py (http://raw.githubusercontent.com/jrjohansson/version_information/master/version_information.py) (deprecated)

```
In [13]: %load_ext version_information
```

Loading extensions from ~/.ipython/extensions is deprecated. We recommend managing extensions like any other Python packages, in site-packages.

In [14]: `version_information scipy, matplotlib`

Out[14]:

Software	Version
Python	3.6.1 64bit [GCC 4.4.7 20120313 (Red Hat 4.4.7-1)]
IPython	6.1.0
OS	Linux 3.10.0 327.36.3.el7.x86_64 x86_64 with redhat 7.2 Maipo
scipy	0.19.1
matplotlib	2.0.2
