Given a general scalar field $T(\mathbf{r})$ and a vector field $\mathbf{v}(\mathbf{r})$, which second derivatives can be taken that are identically zero?

◀ Return

For the vector field

$$\mathbf{v} = -xy^2 \hat{\mathbf{x}} + zy \hat{\mathbf{y}} - 6 \hat{\mathbf{z}}$$

determine the line integral $\int_{\mathcal{P}} \mathbf{v} \cdot d\mathbf{l}$ from the point $(0, 0, 0)$ to $(1, 1, 0)$ along the path $y = x^2, z = 0$.

◀ Return

For the vector field (in cylindrical coordinates)

$$\mathbf{v} = s(1 + \cos \phi) \hat{\mathbf{s}} + s(1 + \sin \phi) \hat{\phi} - sz \hat{\mathbf{z}}$$

determine the surface integral $\int_{\mathcal{S}} \mathbf{v} \cdot d\mathbf{a}$ over the cylindrical surface defined by $s = R$ and $0 < z < L$.

Given the electric field

$$\mathbf{E}(\mathbf{r}) = 2xy \hat{\mathbf{x}} + (x^2 - 2yz) \hat{\mathbf{y}} - y^2 \hat{\mathbf{z}}$$

determine the charge density $\rho(\mathbf{r})$.

◀ Return

Given the charge density $\rho(\mathbf{r}) = kr$, determine the electric field $\mathbf{E}(\mathbf{r})$.

◀ Return

Given a half-circle of charge density λ as shown, determine \mathbf{E} at the origin.

◀ Return

$$\frac{1}{2} \int_V \rho V d\tau = \frac{\epsilon_0}{2} \int_V E^2 d\tau$$

Is this a true statement? Why or why not?

Given a sphere of radius R with uniform surface charge density σ , determine the potential V at the point $\mathbf{r} = (R/2)\hat{\mathbf{z}}$.

◀ Return

Calculate the energy store in the following charge configuration: a sphere of radius a with total charge q spread uniformly on the surface, surrounded by a concentric sphere of radius $b > a$ with total charge $-q$ also uniformly spread on the surface.

Evaluate this integral:

$$\int r^2 \sin(\mathbf{r} \cdot \mathbf{a}) \delta^3(\mathbf{b} - \mathbf{r}) d\tau$$

where integration runs over all space.

Given the potential $V(\mathbf{r}) = xy^2z^3$, determine the charge density $\rho(\mathbf{r})$.

◀ Return

A conducting spherical shell of inner radius a and outer radius b carries a total charge Q . A point charge q is placed at the center. Determine the surface charge densities on the inner and outer surfaces of the conductor.
