

Description

In this assignment, you will read Chapter 5, Table Views, of *iPhone Development Fundamentals* and complete the programming exercise in that chapter. As in the previous assignment, you will use Subversion to manage your source code. The last section of this chapter, *Sorting Table Data*, is optional.

Table views are present in most iPhone applications. Therefore, they are an important part of basic iPhone programming skills. After this chapter, you will learn new chapters whenever the need arises.

You do *not* need a UML diagram for this assignment, and no unit testing is necessary.
