In this exercise, you are asked to go to a few web search engines to search for results for a given set of queries. Then compute certain statistics.

- colt as in "Computational Learning Theory"
- apple as in "Apple Computer"
- china as in "the country of China"
- italian restaurant lewisburg

Examine the first 20 results from each search engine for each query, compute average values for the following.

1. ESL
2. Average rank
3. RankPower

Note: count only the web search results, not the sponsored results.
