

**Homework Assignment #3 – due via Moodle at 9:00 pm on Monday, Apr. 20, 2020**  
**[Prob. 1 revised 4/17/20]**

*Instructions, notes, and hints:*

Provide the details of all solutions, including important intermediate steps. You will not receive credit if you do not show your work. If you justify any approximations you make, you will be given full credit for such answers.

*Assignment:*

1. **[boldface text revised 4/17/20]** The perfect fifth is considered to be the most consonant interval next to the octave. However, many intervals at the low end of the spectrum audible to humans sound dissonant. Using Figs. 5.10 and 8.15 of the textbook (Rossing, Moore, and Wheeler, 3<sup>rd</sup> ed.), briefly explain why the fifth from C<sub>2</sub> (65.41 Hz) to G<sub>2</sub> (98.00 Hz) sounds much less consonant than the fifth from C<sub>5</sub> (523.25 Hz) to G<sub>5</sub> (783.99 Hz). In this case, it is not due to the tuning of the notes to conform to the equally tempered scale.
2. Beats are a linear effect and are most noticeable when two tones that are close in frequency are sounded together. Difference tones are a nonlinear effect and appear at frequencies equal to the differences between integer multiples of the original frequencies of the tones that are sounded. (See Sec. 8.6 of the textbook.) Suppose that two tones with frequencies of 250 Hz and 310 Hz are sounded together. Find the frequencies of all possible 2<sup>nd</sup>-order (quadratic) and 3<sup>rd</sup>-order (cubic) difference tones that could result.
3. Piano tuning can be accomplished by counting the number of beats that are generated by difference tones when two notes are played simultaneously. (Note that the beats heard in this case are the result of the nonlinear intermodulation of the two notes. The beating occurs between harmonics that are nearly the same frequency.) Suppose that a 440 Hz tuning fork confirms that the A<sub>4</sub> note has the correct pitch in the equally tempered scale. The E<sub>5</sub> note should have the frequency 659.25 Hz (660 Hz would be a perfect fifth).
  - a. How many beats per second should the tuner hear when the E<sub>5</sub> note is correctly tuned? (In practice, the tuner would probably count the number of beats in 10 sec and then divide by 10 to obtain the number of beats/sec.)
  - b. The same number of beats/sec would be heard if the E<sub>5</sub> note were accidentally tuned to 660.75 Hz, which is too high. The tuner could determine whether the frequency is correct by slightly increasing the tension on the E<sub>5</sub> strings. Why?
4. For the just intonation scale, verify by multiplication that the raising a note by each of the following pairs of intervals is equivalent to raising the note by an octave:
  - a. Raising a fifth then raising a fourth
  - b. Raising a major sixth then raising a minor third

*(continued on next page)*

5. Repeat the previous problem for the case of the equally tempered scale.
6. Given the frequency ratios for the just intonation scale shown in Fig. 9.5 of the textbook (Rossing, Moore, and Wheeler, 3<sup>rd</sup> ed.), use arithmetical operations to show that the following intervals are perfect fifths, where the first note is lower in pitch than the second note:
  - a. E : B
  - b. G : D
  - c. A : E
7. Find the frequency ratio of the interval D : A in the just intonation scale, where the first note (D) is lower in pitch than the second note (A). *Hint*: It is not 3:2 (highest to lowest).
8. The notes in the western chromatic scale (the one that includes all sharps and flats, 12 notes per octave) are:

C C<sup>#</sup> D D<sup>#</sup> E F F<sup>#</sup> G G<sup>#</sup> A A<sup>#</sup> B C

The “<sup>#</sup>” symbol indicates a sharp, which raises the note by a half step. In the equally tempered scale, a note raised by a sharp is enharmonic with (has the same pitch as) the next higher note lowered by a flat, indicated by the “<sup>b</sup>” symbol. Thus, D<sup>#</sup> is the same as E<sup>b</sup>. By international agreement, the standard frequency of the note A<sub>4</sub> (the A above middle C and near the middle of a piano keyboard) is 440 Hz. Use arithmetical operations to find the frequencies associated with the following notes in the equally tempered scale. You may check your answers using Table 9.2 of the textbook:

- a. D<sub>1</sub>
- b. E<sub>3</sub><sup>b</sup>
- c. G<sub>5</sub><sup>#</sup>
- d. B<sub>7</sub>
