FRIDAY PROJECT

due:  Friday February 23, 9 am

Project:
Make your own model for traffic flow. Use one of your programs and do some variation of it. For example add some construction or a stop light or change the geometry, etc. You may also instead look in the literature or on the web for other models. It is fine if you use what you found already for the daily assignment of Feb. 12. Program this model of your choice and study the resulting flow. Write a paper of about two pages in which you define your model (such that everyone in class could also program it) and describe your results.
