Making linux space available on Windows machine

The following is the description of our Linux administrator, Jeremy Dreese:

The easiest way for the students to map their linux space would be for them to have a $netlog.bat file in their Windows private space. This .bat file would automatically map their linux space when they login. The students would only have to set this up once and it will map their linux space whenever they login to a Windows machine. I have made a template and directions on how to do this and they are located in

```
\\netspace\software\windows\campus\Engineering Applications\Xmanager Enterprise
```
