Formal Properties of Linear Memory Types
Dartmouth Technical Report TR2003-468

Heng Huang, Lea Wittie, and Chris Hawblitzel

Aug 8, 2003

Abstract

Efficient low-level systems need more control over memory than safe high-level languages usually provide. As a result, run-time systems are typically written in unsafe languages such as C. This report describes an abstract machine designed to give type-safe code more control over memory. It includes complete definitions and proofs of preservation, progress, strong normalization, erasure, and translation correctness.

Introduction

This report presents the complete syntax and rules for the abstract machine, called λ^{low}, described in [1]. It then presents a proof of soundness (type safety), which says that well-typed programs will never get stuck. The proof consists of a proof of preservation and a proof of progress, in the syntactic style of [5] (also see [4] for an general introduction to syntactic approaches to semantics and types). It also presents a proof of strong normalization for the "proof" portion of the abstract machine (i.e. for the expressions that type-check in a "limited" environment), and a proof that the types and the "proof" portion of the abstract machine can be erased without upsetting the run-time behavior. Finally, it proves the well-typedness of a translation from λ^C, a CPS- and closure-converted polymorphic lambda calculus [3], to λ^{low}. This report supersedes an earlier report[2].

Formally stated, the theorems proved in this report are:

- **Type preservation:** If $\Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash e : \tau$, $\Psi_{spare}, \Psi_e; \Phi_{spare}, \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash (M, e : \tau)$ and $(M, e) \rightarrow (M', e')$, then $\Psi'_e; \Phi'_e; \Delta; \Gamma; B; \text{limit} \vdash e' : \tau$ and $\Psi_{spare}, \Psi'_e; \Phi_{spare}, \Phi'_e; \Delta; \Gamma; B; \text{limit} \vdash (M', e' : \tau)$, where $(\Phi'_e \dot{\supseteq} \Phi_e)$.
- **Type progress:** If (M, e) is closed and well-typed ($C_{Me} \vdash (M, e : \tau)$ for some τ and $C_{Me} = \Psi_{Me}; \Phi_{Me}; \varnothing; \varnothing; B; \text{limit}$), then either e is a value or else there is some (M', e') so that $(M, e) \rightarrow (M', e')$.
- **Strong normalization:** If $\Psi_{Me}; \Phi_{Me}; \varnothing; \varnothing; \text{true}; i \vdash (M, e : \tau)$, then e must step to a value in a finite sequence of zero or more steps, without changing memory: $(M, e) \rightarrow (M, e_1) \rightarrow \cdots \rightarrow (M, e_n) \rightarrow (M, v)$.
- **Type erasure:**
  - $\dfrac{C \vdash (M,e:\tau) \quad (M,e) \mapsto (M',e')}{\text{erase}((M,e)) \overset{?}{\mapsto} \text{erase}((M',e'))}$
  - $\dfrac{C \vdash (M,e:\tau) \text{ where } C \text{ has an empty } \Delta \text{ and } \Gamma \quad \text{erase}((M,e)) \mapsto (L',d')}{(M,e) \overset{+}{\mapsto} (M',e'), \text{erase}((M',e')) = (L',d')}$
  - $\dfrac{C \vdash (M,e:\tau) \text{ where } C \text{ has an empty } \Delta \text{ and } \Gamma \quad \text{erase}(e) \text{ is a value}}{(M,e) \overset{*}{\mapsto} (M,v), \text{erase}((M,e)) = \text{erase}((M,v))}$
- **Translation type correctness:**
  - If $\Delta; \Gamma \vdash_C e$, then $\mathcal{B}(\Delta); \mathcal{B}(\Gamma) \vdash_{C_2} \mathcal{B}(e)$
  - If $\Delta \vdash_C \Gamma$, then $\mathcal{B}(\Delta) \vdash_{C_2} \mathcal{B}(\Gamma)$
  - If $\Delta; \Gamma \vdash_{C_2} e$, then $\Delta; \Gamma \vdash_F \mathcal{F}(e)$

– If $\Delta \vdash_{C_2} \Gamma$, then $\Delta \vdash_F \Gamma$
– If $\Delta \vdash_F \Gamma$ and $\Delta; \Gamma \vdash_F e$, then $\emptyset; \emptyset; \mathcal{A}_{tyarg}(\Delta),\ R : K_R,\ E : \text{int}; \mathcal{A}(\Gamma)\, R\, E,\ \{g : \tau_g(R,\ E)\}; true; \infty \vdash_L \mathcal{A}(e)\, R\, E\, g : \tau_{halt}$

1 Abstract syntax

This section defines the abstract syntax of λ^{low}. The letter x is used to indicate a value variable, while α is used to indicate a type variable. As usual, we consider expressions and types that differ only in bound variable names to be equivalent.

linearity

$$\phi = \cdot \mid \wedge$$

time limits

$$\text{limit} = I \mid \infty$$

kinds

$$K = J \mid \text{int} \mid \text{bool}$$

$$J = \overset{\phi}{i} \mid K \to J$$

arithmetic

$$i = \cdots \mid -2 \mid -1 \mid 0 \mid 1 \mid 2 \mid \cdots$$

$$b = \text{true} \mid \text{false}$$

$$I = \alpha \mid i \mid I_1 \,\text{iop}\, I_2$$

$$B = \alpha \mid b \mid \neg B \mid B_1 \,\text{bop}\, B_2 \mid I_1 \,\text{cmp}\, I_2$$

$$\text{iop} = + \mid - \mid *$$

$$\text{bop} = \wedge \mid \vee$$

$$\text{cmp} = < \mid > \mid \leq \mid \geq \mid = \mid \neq$$

$$\text{op} = \text{iop} \mid \text{bop} \mid \text{cmp}$$

types

$$\mid \Lambda\alpha : K; B.v \mid \text{let } \langle \overrightarrow{x} \rangle = e_1 \text{ in } e_2 \mid \text{if } e_1 \text{ then } e_2 \text{ else } e_3 \mid \text{if } B \text{ then } e_1 \text{ else } e_2$$
$$\mid \text{union}(b, \tau_1, \tau_2, e) \mid \text{pack}[\tau_1, e] \text{ as } \exists\alpha : K; B.\tau_2 \mid \text{unpack } \alpha, x = e_1 \text{ in } e_2$$

$$\mid \text{case}(b, e) \mid \text{roll}[(\mu\alpha : K.\tau_0)\tau_1 \cdots \tau_n](e) \mid \text{unroll}(e) \mid \text{fix } x : \tau.\text{v} \mid \text{load}(e_{\text{ptr}}, e_{\text{Has}})$$

$$\mid \text{store}(e_{\text{ptr}}\ , e_{\text{Has}}, \text{e}_\text{v}) \mid \text{coerce}(e) \mid \text{distinguish}(I_1, I_2, e_1, e_2) \mid \text{make\_eq}(\tau)$$

$$\mid \text{apply\_eq}(\tau, e_1, e_2) \mid \text{new\_fun}(K) \mid \text{discard\_fun}(e)$$

$$\mid \text{define\_fun}(e, \tau) \mid \text{in\_domain}(I_1, I_2, e_1, e_2) \mid \text{fact}$$

values

$$v = i \mid b \mid \Lambda\alpha : K; B.v \mid \text{pack}[\tau_1, v] \text{ as } \exists\alpha : K; B.\tau_2$$

$$\mid \text{roll}[(\mu\alpha : K.\tau_0)\tau_1 \cdots \tau_n](v) \mid \lambda x : \tau \xrightarrow{\phi,\text{limit}} e \mid \phi\langle \overrightarrow{v} \rangle \mid \text{union}(b, \tau_1, \tau_2, v) \mid \text{fact}$$

untyped expressions

$$d = i \mid b \mid x \mid d_1\, d_2 \mid \langle \overrightarrow{d} \rangle \mid \lambda x \longrightarrow d$$

$$\mid d_1 \,\text{op}\, d_2 \mid \neg d \mid \text{let } \langle \overrightarrow{x} \rangle = d_1 \text{ in } d_2$$

$$\mid \text{if } d_1 \text{ then } d_2 \text{ else } d_3 \mid \text{fix } x.u \mid \text{load}(d_{\text{ptr}}, \langle\rangle) \mid \text{store}(d_{\text{ptr}}\ , \langle\rangle, d_{\text{v}})$$

untyped values

$$u = i \mid b \mid \lambda x \longrightarrow d \mid \langle \overrightarrow{u} \rangle$$

expressions for substitution

$$s = v \mid \text{fix } x : \tau.v$$

environments

$$F = F_1^{K_1} \mid F_2^{K_2} \mid F_3^{K_3} \mid \cdots$$

$$M = \{1 \mapsto v_1, \cdots, n \mapsto v_n\}$$

$$\Psi = \{1 \mapsto \tau_1, \cdots, n \mapsto \tau_n\}$$

$$\Phi = \{F_1^{K_1} \overset{\phi_1}{\mapsto} \delta_1, \cdots, F_n^{K_n} \overset{\phi_n}{\mapsto} \delta_n\}$$

$$\delta = \{0 \mapsto \tau_0, \cdots, n \mapsto \tau_n\}$$

$$\Delta = \{\alpha_1 \mapsto K_1, \cdots, \alpha_n \mapsto K_n\}$$

$$\Gamma = \{x_1 \mapsto \tau_1 \cdots, x_n \mapsto \tau_n\}$$

$$C = \Psi; \Phi; \Delta; \Gamma; B; \mathrm{limit}$$

untyped environments

$$L = \{1 \mapsto u_1, \cdots, n \mapsto u_n\}$$

judgments

$$\Phi; \Delta \vdash \tau : K$$

$$B \vdash B_1 \doteq B_2$$

$$B \vdash I_1 \doteq I_2$$

$$\Phi; B \vdash \tau_1 \equiv \tau_2$$

$$C \vdash e : \tau$$

$$\Psi_{spare}; \Phi_{spare}; C \vdash (M, e : \tau)$$

$$(M, e) \rightarrow (M', e')$$

abbreviations

$$\forall \alpha : K.\tau \triangleq \forall \alpha : K; \mathrm{true}.\tau$$

$$\exists \alpha : K.\tau \triangleq \exists \alpha : K; \mathrm{true}.\tau$$

$$\mathrm{Know}(B) \triangleq \exists \alpha : \mathrm{bool}; B.\ \cdot\langle\rangle$$

$$\mathrm{know}(B) \triangleq \mathrm{pack}[\mathrm{true}, \cdot\langle\rangle] \,\mathrm{as}\, \mathrm{Know}(B)$$

$$\mathrm{let}\, x = e_1 \,\mathrm{in}\, e_2 \triangleq \mathrm{let}\, \langle x \rangle =^{\wedge} \langle e_1 \rangle \,\mathrm{in}\, e_2$$

$$\tau_1 \xrightarrow{\phi} \tau_2 \triangleq \tau_1 \xrightarrow{\phi,\infty} \tau_2$$

$$B_1 \vdash B_2 \triangleq B_1 \vdash B_2 \doteq \mathrm{true}$$

1.1 Notes on environments

We treat the environments Ψ, Φ, δ, Δ, Γ as sets, so the order of elements does not matter: $\{x_1 \mapsto \tau_1, x_2 \mapsto \tau_2\} = \{x_2 \mapsto \tau_2, x_1 \mapsto \tau_1\}$.

The environments Ψ, Φ, δ, Δ, Γ must be well-formed functions (and the definitions in this report apply only to well-formed functions):

$(i \mapsto \tau_1 \in \Psi) \wedge (i \mapsto \tau_2 \in \Psi) \Rightarrow \tau_1 = \tau_2$

$(F^K \overset{\phi_1}{\mapsto} \delta_1 \in \Phi) \wedge (F^K \overset{\phi_2}{\mapsto} \delta_2 \in \Phi) \Rightarrow (\delta_1 = \delta_2) \wedge (\phi_1 = \phi_2)$

$(i \mapsto \tau_1 \in \delta) \wedge (i \mapsto \tau_2 \in \delta) \Rightarrow \tau_1 = \tau_2$

$(\alpha \mapsto K_1 \in \Delta) \wedge (\alpha \mapsto K_2 \in \Delta) \Rightarrow K_1 = K_2$

$(x \mapsto \tau_1 \in \Gamma) \wedge (x \mapsto \tau_2 \in \Gamma) \Rightarrow \tau_1 = \tau_2$

For Ψ, δ, Δ, Γ we use the usual function application notation: $\Gamma(x) = \tau \Leftrightarrow x \mapsto \tau \in \Gamma$.

Each $F_i^{K_i}$ in Φ must suffice to type-check both $\mathrm{Gen}(F_i^{K_i}, I)$ expressions, which are linear, and other expression containing the type operator $F_i^{K_i}$, which may be nonlinear. The $\mathrm{Gen}(F_i^{K_i}, I)$ expression is only valid in a context where $\phi_i = \hat{}$.

Environment splitting

These definitions split environments into two parts, where linear elements must go into exactly one of the parts:

$\Psi = \Psi_1, \Psi_2 \Leftrightarrow (\Psi = \Psi_1 \cup \Psi_2) \wedge (domain(\Psi_1) \not\cap domain(\Psi_2))$

$$\begin{aligned}
\Phi = \Phi_1, \Phi_2 \Leftrightarrow \forall F^K.((F^K \overset{\hat{}}{\mapsto} \delta \in \Phi) &\Rightarrow (F^K \overset{\hat{}}{\mapsto} \delta \in \Phi_1) xor (F^K \overset{\hat{}}{\mapsto} \delta \in \Phi_2)) \\
\wedge((F^K \overset{\hat{}}{\mapsto} \delta \in \Phi) &\Leftarrow (F^K \overset{\hat{}}{\mapsto} \delta \in \Phi_1) \vee (F^K \overset{\hat{}}{\mapsto} \delta \in \Phi_2)) \\
\wedge((F^K \overset{\phi}{\mapsto} \delta \in \Phi) &\Leftrightarrow (F^K \overset{\phi_1}{\mapsto} \delta \in \Phi_1)) \\
\wedge((F^K \overset{\phi}{\mapsto} \delta \in \Phi) &\Leftrightarrow (F^K \overset{\phi_2}{\mapsto} \delta \in \Phi_2))
\end{aligned}$$

$$\begin{aligned}
\Phi; \Delta \vdash \Gamma = \Gamma_1, \Gamma_2 \Leftrightarrow \forall x, \tau.(\Phi; \Delta \vdash \tau :\dot{i} &\Rightarrow ((\Gamma(x) = \tau) \Leftrightarrow (\Gamma_1(x) = \tau)) \wedge ((\Gamma(x) = \tau) \Leftrightarrow (\Gamma_2(x) = \tau))) \\
\wedge(\Phi; \Delta \vdash \tau :\hat{i} &\Rightarrow ((\Gamma(x) = \tau) \Rightarrow (\Gamma_1(x) = \tau) xor (\Gamma_2(x) = \tau))) \\
\wedge(\Phi; \Delta \vdash \tau :\hat{i} &\Rightarrow ((\Gamma(x) = \tau) \Leftarrow (\Gamma_1(x) = \tau) \vee (\Gamma_2(x) = \tau)))
\end{aligned}$$

$\Psi; \Phi; \Delta; \Gamma; B; \mathrm{limit} = (\Psi_1; \Phi_1; \Delta; \Gamma_1; B; \mathrm{limit}), (\Psi_2; \Phi_2; \Delta; \Gamma_2; B; \mathrm{limit}) \Leftrightarrow (\Psi = \Psi_1, \Psi_2) \wedge (\Phi = \Phi_1, \Phi_2) \wedge (\Phi; \Delta \vdash \Gamma = \Gamma_1, \Gamma_2)$

Environment extension

These add new elements to environments:

$\Psi, i \mapsto \tau \triangleq \Psi \cup \{i \mapsto \tau\}$, where $i \notin domain(\Psi)$

$\Phi, F^K \overset{\phi}{\mapsto} \delta \triangleq \Phi \cup \{F^K \overset{\phi}{\mapsto} \delta\}$, where $F^K \notin domain(\Phi)$

$\Delta, \alpha \mapsto K \triangleq \Delta \cup \{\alpha \mapsto K\}$, where $\alpha \notin domain(\Delta)$

$\Gamma, x \mapsto \tau \triangleq \Gamma \cup \{x \mapsto \tau\}$, where $x \notin domain(\Gamma)$

$B_1, B_2 \triangleq B_1 \wedge B_2$

$(\Psi; \Phi; \Delta; \Gamma; B; limit), i \mapsto \tau \triangleq (\Psi, i \mapsto \tau; \Phi; \Delta; \Gamma; B; limit)$

$(\Psi; \Phi; \Delta; \Gamma; B; limit), F^K \overset{\phi}{\mapsto} \delta \triangleq (\Psi; \Phi, F^K \overset{\phi}{\mapsto} \delta; \Delta; \Gamma; B; limit)$

$(\Psi; \Phi; \Delta; \Gamma; B; limit), \alpha \mapsto K_\alpha \triangleq (\Psi; \Phi; \Delta, \alpha \mapsto K_\alpha; \Gamma; B; limit)$,
where α does not appear anywhere in $(\Psi; \Phi; \Delta; \Gamma; B; limit)$.

$(\Psi; \Phi; \Delta; \Gamma; B; limit), x \mapsto \tau \triangleq (\Psi; \Phi; \Delta; \Gamma, x \mapsto \tau; B; limit)$,
where x does not appear anywhere in $(\Psi; \Phi; \Delta; \Gamma; B; limit)$ and $\Phi; \Delta \vdash \tau :\overset{\phi}{i}$.

$(\Psi; \Phi; \Delta; \Gamma; B_1; limit), B_2 \triangleq (\Psi; \Phi; \Delta; \Gamma; B_1, B_2; limit)$

Nonlinear environments

The $\cdot$ operator removes any linearity from an environment. We use it to prohibit linearity in some of the type checking rules.

$$\dot{\Phi} \triangleq \{F^K \dot{\mapsto} \delta | F^K \overset{\phi}{\mapsto} \delta \in \Phi\}$$

$$\dot{\Gamma}\ (\Phi, \Delta) \triangleq \{x \mapsto \tau | (x \mapsto \tau \in \Gamma) \wedge (\Phi; \Delta \vdash \tau : \dot{i})\}$$

If $C = \Psi; \Phi; \Delta; \Gamma; B; \text{limit}$, then $\dot{C} \triangleq \emptyset; \dot{\Phi}; \Delta; \dot{\Gamma}\ (\Phi, \Delta); B; limit$.

Environment subsets

As the abstract machine steps from one state to the next, the Φ environment must grow to accomodate new type sequence allocations. Therefore, we define a subset operator $\dot{\subseteq}$ for Φ to indicate that the Φ_2 after a step is an extension of the Φ_1 before the step. To accomodate the discard_fun(e) expression, this operator must be able to demote a linear mapping $F^K \overset{\wedge}{\mapsto} \delta$ to a nonlinear mapping $F^K \dot{\mapsto} \delta$:

$$\Phi_1 \dot{\subseteq} \Phi_2 \Leftrightarrow \forall F^K.(F^K \overset{\phi_1}{\mapsto} \delta_1 \in \Phi_1) \Rightarrow \exists \delta_2.((F^K \overset{\phi_2}{\mapsto} \delta_2 \in \Phi_2) \wedge (\delta_1 \subseteq \delta_2) \wedge ((\phi_2 =^\wedge) \Rightarrow (\phi_1 =^\wedge)))$$

$$(\Psi; \Phi_1; \Delta; \Gamma; B; \text{limit}) \dot{\subseteq} (\Psi; \Phi_2; \Delta; \Gamma; B; \text{limit}) \Leftrightarrow (\Phi_1 \dot{\subseteq} \Phi_2)$$

To prove a substitution lemma, we need a notion of environment weakening. Weakening, however, cannot add new linear elements nor change the linearity of an existing mapping, so we need a different subset operator, $\overset{\wedge}{\subseteq}$:

$$\begin{aligned} \Phi_1 \overset{\wedge}{\subseteq} \Phi_2 \quad \Leftrightarrow \quad & (\forall F^K.(F^K \overset{\phi}{\mapsto} \delta_1 \in \Phi_1) \Rightarrow \exists \delta_2.((F^K \overset{\phi}{\mapsto} \delta_2 \in \Phi_2) \wedge (\delta_1 \subseteq \delta_2))) \\ & \wedge (\forall F^K.(F^K \overset{\wedge}{\mapsto} \delta_2 \in \Phi_2) \Rightarrow \exists \delta_1.((F^K \overset{\wedge}{\mapsto} \delta_1 \in \Phi_1) \wedge (\delta_1 \subseteq \delta_2))) \end{aligned}$$

$$(\Psi; \Phi_1; \Delta_1; \Gamma_1; B; \text{limit}) \subseteq (\Psi; \Phi_2; \Delta_2; \Gamma_2; B; \text{limit}) \Leftrightarrow (\Phi_1 \overset{\wedge}{\subseteq} \Phi_2) \wedge (\Delta_1 \subseteq \Delta_2) \wedge (\Phi; \Delta \vdash \Gamma_1 \subseteq \Gamma_2)$$

where we define subset for Γ as:

$$\Phi; \Delta \vdash \Gamma_1 \subseteq \Gamma_2 \Leftrightarrow \Gamma_1, x_1 \mapsto \tau_1, \ldots, x_n \mapsto \tau_n = \Gamma_2$$

where $\Phi; \Delta \vdash \tau_1 : \dot{i_1}, \ldots, \Phi; \Delta \vdash \tau_n : \dot{i_n}$.

1.2 Arithmetic constraints

The notation $B \vdash I_1 \doteq I_2$ means that for all possible substitutions of integer constants for integer variables, B implies that I_1 is equal to I_2. Similarly, $B \vdash B_1 \doteq B_2$ means that for all possible substitutions of integer constants for integer variables and boolean constants for boolean variables, B implies that B_1 is equal to B_2.

2 Type equivalence

Type equivalence $\Phi; B \vdash \tau_1 \equiv \tau_2$ is only well-defined with respect to an environment $\Phi; B$. When this environment is clear, however, we will often just write $\tau_1 \equiv \tau_2$ by itself, for convenience.

$$\Phi; B \vdash \tau \equiv \tau$$

$$\frac{\Phi; B \vdash \tau_1 \equiv \tau_2}{\Phi; B \vdash \tau_2 \equiv \tau_1}$$

$$\frac{\Phi; B \vdash \tau_1 \equiv \tau_2 \quad \Phi; B \vdash \tau_2 \equiv \tau_3}{\Phi; B \vdash \tau_1 \equiv \tau_3}$$

$$\Phi; B \vdash (\lambda\alpha : K.\tau_b)\tau_a \equiv [\alpha \mapsto \tau_a]\tau_b$$

$$\frac{B \vdash I \doteq i}{\Phi, \mathrm{F}^K \dot{\mapsto} \delta; B \vdash \mathrm{F}^K I \equiv \delta(i)}$$

$$\frac{B \vdash I_1 \doteq I_2}{\Phi; B \vdash I_1 \equiv I_2}$$

$$\frac{B \vdash B_1 \doteq B_2}{\Phi; B \vdash B_1 \equiv B_2}$$

$$\Phi; B \vdash \mathrm{Eq}(\tau_1, \tau_2) \equiv \mathrm{Eq}(\tau_2, \tau_1)$$

$$\frac{\forall i.(\Phi; B \vdash \tau_i \equiv \tau_i')}{\Phi; B \vdash T[\tau_1, \ldots, \tau_n] \equiv T[\tau_1', \ldots, \tau_n']}$$

Rather than writing each of the congruence rules separately ($\frac{\tau \equiv \tau'}{\lambda\alpha:K.\tau \equiv \lambda\alpha:K.\tau'}$, etc.), we use T to indicate a type with one or more (shallowly dug) holes in it, and $T[\tau_1, \ldots, \tau_n]$ to indicate the type with the holes replaced by $\tau_1, \ldots, \tau_n$, so that a single type equivalence rule covers all the cases. This is only for notational convenience.

$$T[\tau] = \lambda\alpha : K.\tau \,|\, \mu\alpha : K.\tau \,|\, \phi\langle\tau\rangle \,|\, \mathrm{Int}(\tau) \,|\, \mathrm{Bool}(\tau)$$

$$T[\tau_1, \tau_2] = \tau_1\,\tau_2 \,|\, \forall\alpha : K; \tau_1.\tau_2 \,|\, \exists\alpha : K; \tau_1.\tau_2 \,|\, \tau_1 \longrightarrow \tau_2 \,|\, \phi\langle\tau_1, \tau_2\rangle$$

$$|\, \mathrm{Has}(\tau_1, \tau_2) \,|\, \mathrm{Gen}(\tau_1, \tau_2) \,|\, \mathrm{Eq}(\tau_1, \tau_2) \,|\, \mathrm{InDomain}(\tau_1, \tau_2)$$

$$T[\tau_1, \tau_2, \tau_3] = \mathrm{Union}(\tau_1, \tau_2, \tau_3) \,|\, \phi\langle\tau_1, \tau_2, \tau_3\rangle$$

$$T[\tau_1, \tau_2, \tau_3, \ldots, \tau_n] = \phi\langle\tau_1, \tau_2, \tau_3, \ldots, \tau_n\rangle$$

3 Evaluation rules

3.1 Definitions

- $(M_1, e_1) \overset{?}{\mapsto} (M_2, e_2)$ means (M_1, e_1) progresses in zero or one steps to (M_2, e_2).
- $(M_1, e_1) \overset{*}{\mapsto} (M_2, e_2)$ means (M_1, e_1) progresses in zero or more steps to (M_2, e_2).
- $(M_1, e_1) \overset{+}{\mapsto} (M_2, e_2)$ means (M_1, e_1) progresses in one or more steps to (M_2, e_2).
- $(M_1, e_1) \overset{?,(evaluation-rule)}{\mapsto} (M_2, e_2)$ means (M_1, e_1) progresses to (M_2, e_2) by applying the given evaluation rule zero or one times.
- $(M_1, e_1) \overset{*,(evaluation-rule)}{\mapsto} (M_2, e_2)$ and $(M_1, e_1) \overset{+,(evaluation-rule)}{\mapsto} (M_2, e_2)$ are defined in the same way as the above definition.
- simplify$(i_1 + i_2) = i_3$, where i_3 is the sum of i_1 and i_2
- simplify$(i_1 - i_2) = i_3$, where i_3 is i_1 minus i_2

- $\text{simplify}(i_1 * i_2) = i_3$, where i_3 is the product of i_1 and i_2
- $\text{simplify}(i_1 \,\text{cmp}\, i_2) = b$, where b is true iff $\text{cmp}\,(i_1, i_2)$ is true
- $\text{simplify}(b_1 \wedge b_2) = b_3$, where b_3 is true iff b_1 and b_2 are true
- $\text{simplify}(b_1 \vee b_2) = b_3$, where b_3 is true iff b_1 or b_2 is true
- $\text{simplify}(\neg b_1) = b_2$, where b_2 is true iff b_1 is false

3.2 Rules

$$(E-LOAD)(M, \text{load}(i, fact)) \rightarrow (M, ^\wedge \langle M(i), fact\rangle)$$

$$(E-STORE)(M, \text{store}(i, fact, v)) \rightarrow ([i \mapsto v]M, fact)$$

$$(E-ABSAPP1)(\lambda x : \tau \xrightarrow{\phi, I} e_1)v_2 \rightarrow \text{coerce}([x \mapsto v_2]e_1)$$

$$(E-ABSAPP2)(\lambda x : \tau \xrightarrow{\phi, \infty} e_1)v_2 \rightarrow [x \mapsto v_2]e_1$$

$$(E-COERCE)\text{coerce}(v) \rightarrow v$$

$$(E-TAPPTABS)(\Lambda\alpha : K; B.v)\tau \rightarrow [\alpha \mapsto \tau]v$$

$$(E-LET)\text{let}\,\langle x_1, \cdots, x_n\rangle = \phi\langle v_1, \cdots, v_n\rangle\,\text{in}\,e \rightarrow [x_1 \mapsto v_1, \cdots, x_n \mapsto v_n]e$$

$$(E-SIMPLIFY1)v_1\,\text{op}\,v_2 \rightarrow \text{simplify}(v_1\,\text{op}\,v_2)$$

$$(E-SIMPLIFY2)\neg v \rightarrow \text{simplify}(\neg v)$$

$$(E-IF1)\text{if}\,true\,\text{then}\,e_1\,\text{else}\,e_2 \rightarrow e_1$$

$$(E-IF2)\text{if}\,false\,\text{then}\,e_1\,\text{else}\,e_2 \rightarrow e_2$$

$$(E-IFB1)\frac{\vdash B \doteq true}{\text{if}\,B\,\text{then}\,e_1\,\text{else}\,e_2 \rightarrow e_1}$$

$$(E-IFB2)\frac{\vdash B \doteq false}{\text{if}\,B\,\text{then}\,e_1\,\text{else}\,e_2 \rightarrow e_2}$$

$$(E-UNPACK)\text{unpack}\,\alpha, x = (\text{pack}[\tau_1, v_1]\,\text{as}\,\tau_2)\text{in}\,e_2 \rightarrow [\alpha \mapsto \tau_1, x \mapsto v_1]e_2$$

$$(E-UNROLL)\text{unroll}(\text{roll}[\tau](v)) \rightarrow v$$

$$(E-DISCARDFUN)\text{discard\_fun}(fact) \rightarrow \cdot\langle\rangle$$

$$(E-DEFINEFUN)\text{define\_fun}(fact, \tau) \rightarrow^\wedge \langle fact, fact, fact\rangle$$

Rather than writing each of the congruence rules separately ($\frac{e_2 \rightarrow e_2'}{v_1\ e_2 \rightarrow v_1\ e_2'}$, etc.), we use E to indicate an expression with one (shallowly dug) hole in it, and $E[e]$ to indicate the expression with the hole replaced by e, so that a single evaluation rule covers all the cases. This is only for notational convenience.

$$E[e] = e\tau \mid \text{pack}[\tau_1, e] \text{ as } \exists\alpha : K; B.\tau_2 \mid \text{unpack}\,\alpha, x = e \text{ in } e_2 \mid \text{roll}[\tau](e) \mid \text{unroll}(e)$$

5 Type erasure rules

The erasure rules are defined only for well-typed terms: to erase types, we require a derivation of some judgment $C \vdash (M, e : \tau)$ to be given, and we use the derivation to annotate subexpressions inside (M, e) with types. Specifically, if $e = ...e_1...$, and the derivation of $C \vdash (M, e : \tau)$ contains the judgment $C_1 \vdash e_1 : \tau_1$, then we annotate e with τ_1 as $e = ...(e_1 : \tau_1)...$ when convenient. We annotate types with kinds in a similar fashion. These annotations guide the erasure rules.

$$(ER-M)\,\text{erase}((M, e)) = (\,\text{erase}(M),\, \text{erase}(e))$$

$$(ER-M2)\,\text{erase}(M(e)) = (M(\,\text{erase}(e)))$$

$$(ER-i)\,\text{erase}(i) = i$$

$$(ER - FACT)\,\text{erase}(\text{fact}) = \langle\rangle$$

5.1 Untyped evaluation rules

Some of the evaluation rules will work for both typed and untyped evaluation. These new rules apply to untyped evaluation when the standard evaluation rules cannot.

$$(U - LOAD)(L, \text{load}(i, \langle\rangle)) \to (L,\,\langle L(i), \langle\rangle\rangle)$$

$$(U - STORE)(L, \text{store}(i, \langle\rangle, u)) \to ([i \mapsto u]L, \langle\rangle)$$

$$(U - ABSAPP)(\lambda x \longrightarrow d_1)u_2 \to [x \mapsto u_2]d_1$$

$$(U - FIX)\text{fix}\,x.u \to [x \mapsto \text{fix}\,x.u]u$$

6 Type safety

This section proves the two properties constituting type safety: preservation and progress.

6.1 Basic Properties

6.1.1 LEMMA [WEAKENING FOR TERMS]

$(C_1 \subseteq C_2) \wedge (C_1 \vdash e : \tau) \Rightarrow (C_2 \vdash e : \tau)$. Proof by induction on the type derivation. The leaves of the tree are the interesting cases; they rely on the fact that C_2 only extends C_1 with nonlinear mappings.

6.1.2 LEMMA [WEAKENING FOR TYPES]

$(C_1 \subseteq C_2) \wedge (C_1 \vdash \tau : K) \Rightarrow (C_2, C_3 \vdash \tau : K)$. Proof by induction on the kinding derivation.

6.1.3 LEMMA [SPLIT SUBSET]

If $C = C_1, C_2$ and $C_1 \dot{\subseteq} C_1'$, then there is some C_2' such that $C_2 \hat{\subseteq} C_2'$ and $C_1, C_2 \dot{\subseteq} C_1', C_2'$.

If $C = C_1, C_2$ and $C_1 \dot{\subseteq} C_1'$, then there is some C_2' such that $C_2 \subseteq C_2'$ and $C_1, C_2 \dot{\subseteq} C_1', C_2'$. Proof: if $C_1 \dot{\subseteq} C_1'$, then C_1' can differ from C_1 only in three ways (the proofs for the three cases can easily be combined into a single proof):

- For some $F^K \overset{\phi}{\mapsto} \delta$, it can add new elements to δ. In this case, simply add the same elements to the same δ in C_2 (by the definition of splitting C_1, C_2, we know C_2 contains the same δ) to get C_2'.
- It can change a $F^K \hat{\mapsto} \delta$ to $F^K \dot{\mapsto} \delta$. In this case, C_2 must already contain $F^K \dot{\mapsto} \delta$, so choose $C_2' = C_2$.
- It can add a new $F^K \overset{\phi}{\mapsto} \delta$, which appears neither in C_1 nor C_2. In this case, add $F^K \dot{\mapsto} \delta$ to C_2 to get C_2'.

6.2 Preservation

6.2.1 LEMMA [INVERSION]

In this lemma, $C = \Psi; \Phi; \Delta; \Gamma; B; \text{limit}_C$

1. (VAR) If $C \vdash x : \tau$, then $x : \tau \in C$.
2. (APP) If $C \vdash e_1 e_2 : \tau$, then there is some type τ_a such that $C_1 \vdash e_1 : \tau_a \overset{\text{limit}_f}{\longrightarrow} \tau'$, $\tau \equiv \tau'$ and $C_2 \vdash e_2 : \tau_a$, $((\text{limit}_C = \text{limit}_f = \infty)$ or $(\text{limit}_f < \text{limit}_C)$ or $(\text{limit}_C = \infty, \text{limit}_f = I, \Phi; \Delta \vdash \tau' \overset{\phi}{:} 0))$.
3. (ABS) If $C \vdash \lambda x : \tau_x \overset{\phi, \text{limit}_f}{\longrightarrow} e : \tau_1 \overset{\text{limit}_f}{\longrightarrow} \tau_2$, then $\tau_1 \equiv \tau_x$ and $\Psi; \Phi; \Delta; \Gamma, x : \tau_x; B; \text{limit}_f \vdash e : \tau_2$. $(C \vdash \tau_1 :: K_1$, $C \vdash \tau_x :: K_1)$, $(\text{limit}_f = \infty)$ or $(\Phi; \Delta \vdash \text{limit}_f : \text{int} \;\; B \vdash \text{limit}_f \geq 0)$
4. (TAPP) If $C \vdash e_1 \tau_2 : \tau$, then there is $[\alpha \mapsto \tau_2]\tau_1 \equiv \tau$, and $C \vdash e_1 : \forall \alpha : K; B.\tau_1$, $C \vdash \tau_2 : K$, $C \vdash [\alpha \mapsto \tau_2]B$.
5. (TABS) If $C \vdash \Lambda \alpha : K_\alpha; B_\alpha.v : \forall \alpha : K; B'.\tau'$, then $K_\alpha = K$ and $C, \alpha : K_\alpha, B' \vdash v : \tau'$ and $C, \alpha : K_\alpha \vdash B' : \text{bool}$, $B' \equiv B_\alpha$, $\tau' \equiv \tau$.
6. (TUPLE)If $C \vdash \phi\langle \overrightarrow{e} \rangle : \tau$, then there is $\phi\langle \overrightarrow{\tau'} \rangle \equiv \tau$, and $C \vdash \phi\langle \overrightarrow{e} \rangle : \phi\langle \overrightarrow{\tau'} \rangle$, $\forall i.(C_i \vdash e_i : \tau_i')$, $C \vdash \phi\langle \overrightarrow{\tau'} \rangle : K$.
7. (PROJECT)If $C \vdash \text{let } \langle \overrightarrow{x} \rangle = e_a \text{ in } e_b : \tau$, then there is $\tau_b \equiv \tau$, and $C \vdash \text{let } \langle \overrightarrow{x} \rangle = e_a \text{ in } e_b : \tau_b$, and $C_{e_a} \vdash e_a : \phi\langle \overrightarrow{\tau'} \rangle$, $C_{e_b}, \overrightarrow{x : \tau'} \vdash e_b : \tau_b$.
8. (LOAD)If $C \vdash \text{load}(e_{\text{ptr}}, e_{\text{Has}}) : \tau$, then there is $\hat{} \langle \tau', \text{Has}(I, \tau') \rangle \equiv \tau$ and $C \vdash \text{load}(e_{\text{ptr}}, e_{\text{Has}}) :\hat{} \langle \tau', \text{Has}(I, \tau') \rangle$, $C_{e_{\text{ptr}}} \vdash e_{\text{ptr}} : \text{Int}(I)$, $C_{e_{\text{Has}}} \vdash e_{\text{Has}} : \text{Has}(I, \tau')$, $(C = C_{e_{\text{ptr}}}, C_{e_{\text{Has}}})$.
9. (STORE) $C \vdash \text{store}(e_{\text{ptr}}, e_{\text{Has}}, e_{\text{v}}) : \tau$, then there is $\text{Has}(I, \tau_2) \equiv \tau$, and $C_{e_{\text{ptr}}} \vdash e_{\text{ptr}} : \text{Int}(I)$, $C_{e_{\text{has}}} \vdash e_{\text{has}} : \text{Has}(I, \tau_1)$, $C_{e_{\text{v}}} \vdash e_{\text{v}} : \tau_2$, $C \vdash \tau_2 \dot{:} 1$.
10. (FIX)$C \vdash \text{fix } x : \tau_x.v : \tau$, then $\tau \equiv \tau_x$ and $C, x : \tau_x \vdash v : \tau$, $C \vdash \tau \overset{\phi}{\dot{:}} i$
11. (UNROLL)$C \vdash \text{unroll}(e_0) : \tau$, then there is $([\alpha \mapsto \mu\alpha : K.\tau_0]\tau_0)\tau_1 \cdots \tau_n \equiv \tau$, and $C \vdash \tau \overset{\phi}{\dot{:}} i$, $C \vdash e_0 : (\mu\alpha : K.\tau_0)\tau_1 \cdots \tau_n$
12. (ROLL)$C \vdash \text{roll}[\tau](e) : \tau'$, then there is $(\mu\alpha : K.\tau_0)\tau_1 \cdots \tau_n \equiv \tau' \equiv \tau$, and $C \vdash \tau \overset{\phi}{\dot{:}} i$, $C \vdash e : ([\alpha \mapsto \mu\alpha : K.\tau_0]\tau_0)\tau_1 \cdots \tau_n$
13. (UNPACK)$C_{e_1}, C_{e_2} \vdash \text{unpack } \alpha, x = e_1 \text{ in } e_2 : \tau$, then there is $\tau' \equiv \tau$, and $C_{e_1}, C_{e_2} \vdash \text{unpack } \alpha, x = e_1 \text{ in } e_2 : \tau'$, $C_{e_1} \vdash e_1 : \exists \alpha : K; B_\alpha.\tau_1$, $C_{e_2}, \alpha : K, x : \tau_1, B_\alpha \vdash e_2 : \tau'$, $C \vdash \tau' : K_2$

14. (PACK)$C \vdash \text{pack}[\tau_1, e] \text{ as } \exists\alpha : K; \tau_B.\tau_2' : \tau$, then $\tau \equiv \exists\alpha : K; B_\alpha.\tau_2$, $\tau_2' \equiv \tau_2$, $\tau_B \equiv B_\alpha$ and $C \vdash \tau_1 : K$, $C \vdash [\alpha \mapsto \tau_1]\tau_B$, $C \vdash e : [\alpha \mapsto \tau_1]\tau_2'$, $C \vdash \exists\alpha : K; \tau_B.\tau_2' :\dot{i}^{\phi}$

15. (DISTINGUISH)$C \vdash \text{distinguish}(I_1, I_2, e_1, e_2) : \tau$, then there is $\wedge\langle \text{Know}(I_1 \neq I_2), \text{Has}(I_1, \tau_1), \text{Has}(I_2, \tau_2)\rangle \equiv \tau$, and $C_{e_1} \vdash e_1 : \text{Has}(I_1, \tau_1)$, $C_{e_2} \vdash e_2 : \text{Has}(I_2, \tau_2)$, $C \vdash I_1 : \text{int}$, $C \vdash I_2 : \text{int}$

16. (NEWFUN)$\dot{C} \vdash \text{new\_fun}(J) : \tau$, then $\tau \equiv \exists\alpha : \text{int} \to J.\text{Gen}(\alpha, 0)$

17. (DEFINEFUN)$C \vdash \text{define\_fun}(e, \tau_a) : \tau$, then there is $\wedge\langle \text{Gen}(\tau_f, I+1), \text{Eq}(\tau_f I, \tau_a), \text{InDomain}(I, \tau_f)\rangle \equiv \tau$ and $C \vdash e : \text{Gen}(\tau_f, I)$, $C \vdash \tau_f : \text{int} \to J$, $C \vdash \tau_a : J$

18. (DISCARDFUN)$C \vdash \text{discard\_fun}(e_0) : \tau'$, then $\tau' \equiv \cdot\langle\rangle$ and $C \vdash e_0 : \text{Gen}(\tau, I)$

19. (INDOMAIN)$C \vdash \text{in\_domain}(I_1, I_2, e_1, e_2) : \tau$, then there is $\wedge\langle \text{Know}(0 \leq I_1 \wedge I_1 < I_2), \text{Gen}(\tau_f, I_2)\rangle \equiv \tau$ and $C \vdash I_1 : \text{int}$, $C \vdash I_2 : \text{int}$, $C_{e_1} \vdash e_1 : \text{InDomain}(I_1, \tau_f)$, $C_{e_2} \vdash e_2 : \text{Gen}(\tau_f, I_2)$

20. (MAKEEQ)$\dot{C} \vdash \text{make\_eq}(\tau_0) : \tau$, then $\text{Eq}(\tau_0, \tau_0) \equiv \tau$ and $\dot{C} \vdash \tau_0 : K$

21. (APPLYEQ)$C \vdash \text{apply\_eq}(\tau_f, e_1, e_2) : \tau$, then there is τ_b, $\tau_f\tau_b \equiv \tau$ and $C \vdash \text{apply\_eq}(\tau_f, e_1, e_2) : \tau_f\tau_b$, $C \vdash \tau_f : K \to J$, $C \vdash \tau_a : K$, $C \vdash \tau_b : K$, $C \vdash e_1 : \text{Eq}(\tau_a, \tau_b)$, $C \vdash e_2 : \tau_f\tau_a$

22. (CASE)$C \vdash \text{case}(b, e) : \tau$, then $\tau \equiv \tau_i$ $(i = \begin{matrix} 1\, if\, b \\ 2\, if\, \neg b \end{matrix})$ and $C \vdash e : \text{Union}(b, \tau_1, \tau_2)$

23. (UNION)$C \vdash \text{union}(\tau_b, \tau_1', \tau_2', e) : \text{Union}(b, \tau_1, \tau_2)$, then $\tau_1 \equiv \tau_1'$, $\tau_2 \equiv \tau_2'$, $\tau_b \equiv b$, and $C \vdash \tau_1' : K$, $C \vdash \tau_2' : K$, $C \vdash e : \tau_i$' $(i = \begin{matrix} 1\, if\, \tau_b \\ 2\, if\, \neg\tau_b \end{matrix})$

24. (COERCE)$\Psi; \Phi; \Delta; \Gamma; B; \text{limit}_1 \vdash \text{coerce}(e) : \tau$, then there is $\tau' \equiv \tau$, and $\Psi; \Phi; \Delta; \Gamma; B; \text{limit}_1 \vdash \text{coerce}(e) : \tau$, $\Psi; \Phi; \Delta; \Gamma; B; I_2 \vdash e : \tau'$, $((\text{limit}_1 = \infty \wedge \tau :\dot{0}^{\phi})$ or $(\text{limit}_1 = I_1 > I_2))$.

Proof :

All the proofs are similiar, so we only prove some cases as example.

1. (VAR) If $C \vdash x : \tau$, then $x : \tau \in C$.
For $C \vdash x : \tau$, we only have two type checking rules to use. (T-EQ) and (T-VAR).
If using (T-EQ), then there will be τ_n. For τ_n, we will use (T-VAR) for $C \vdash x : \tau_n$. $(\tau_1 \equiv \cdots \equiv \tau_n \equiv \tau)$
If using (T-VAR), then τ_n is τ.
By (T-VAR) rule, we obtain $\dot{C}_0, x : \tau_n \vdash x : \tau_n$, then $C = \dot{C}_0, x : \tau_n$
By (T-EQ) rule, thus $x : \tau \in C$.

2. (APP) If $C \vdash e_1 e_2 : \tau$, then there is some type τ_a such that $C_1 \vdash e_1 : \tau_a \xrightarrow{\text{limit}_f} \tau'$, $\tau \equiv \tau'$ and $C_2 \vdash e_2 : \tau_a$, $((\text{limit}_C = \text{limit}_f = \infty)$ or $(\text{limit}_f < \text{limit}_C)$ or $(\text{limit}_C = \infty, \text{limit}_f = I, \Phi; \Delta \vdash \tau' :\dot{0}^{\phi}))$.
For $C \vdash e_1 e_2 : \tau$, we only have two type checking rules to use. (T-EQ) and (T-APP).
If using (T-EQ), then there will be τ'. For τ', we will use (T-APP) for $C \vdash e_1 e_2 : \tau'$. $(\tau \equiv \tau_1 \equiv \cdots \equiv \tau_n \equiv \tau')$
If using (T-APP), then τ' is τ.
By (T-APP) rule, we obtain $C \vdash e_1 e_2 : \tau'$, $C_1 \vdash e_1 : \tau_a \xrightarrow{\text{limit}_f} \tau'$, and $C_2 \vdash e_2 : \tau_a$, $((\text{limit}_C = \text{limit}_f = \infty)$ or $(\text{limit}_f < \text{limit}_C)$ or $(\text{limit}_C = \infty, \text{limit}_f = I, \Phi; \Delta \vdash \tau' :\dot{0}^{\phi}))$.

We can use the similar proof to prove the other propositions.

6.2.2 LEMMA [LIMIT-CHANGE]

We define $s = v \mid \mathrm{fix}\, x : \tau.v$.

If $\Psi; \Phi; \Delta; \Gamma; B; \mathrm{limit}_1 \vdash s : \tau$, then $\Psi; \Phi; \Delta; \Gamma; B; \mathrm{limit}_2 \vdash s : \tau$

Proof by induction on the type derivation:

1. $s = i$

then $\varnothing; \dot{\Phi}; \Delta; \dot{\Gamma}; B; \mathrm{limit}_1 \vdash i : \tau$

By (T-INT) rule,

$\varnothing; \dot{\Phi}; \Delta; \dot{\Gamma}; B; \mathrm{limit}_2 \vdash i : \tau$

2. $s = b$

then $\varnothing; \dot{\Phi}; \Delta; \dot{\Gamma}; B; \mathrm{limit}_1 \vdash b : \tau$

By (T-BOOL) rule,

$\varnothing; \dot{\Phi}; \Delta; \dot{\Gamma}; B; \mathrm{limit}_2 \vdash b : \tau$

3. $s = \lambda x : \tau_x \stackrel{\phi,\mathrm{limit}_f}{\longrightarrow} v$

$\Psi; \Phi; \Delta; \Gamma; B; \mathrm{limit}_1 \vdash \lambda x : \tau \stackrel{\phi,\mathrm{limit}_f}{\longrightarrow} v : \tau_x \xrightarrow{f} \tau_v$

By Lemma (6.2.1.(3)), we know $\tau \equiv \tau_x$, and $\Psi; \Phi; \Delta; \Gamma, x : \tau; B; \mathrm{limit}_f \vdash v : \tau_v$, $\Phi; \Delta \vdash \tau : K$

By (T-ABS) rule, we obtain $\Psi; \Phi; \Delta; \Gamma; B; \mathrm{limit}_2 \vdash \lambda x : \tau \stackrel{\phi,\mathrm{limit}_f}{\longrightarrow} v : \tau \xrightarrow{f} \tau_v$

4. $s = \mathrm{fact}$

$\varnothing; \dot{\Phi}; \Delta; \dot{\Gamma}; B; \mathrm{limit}_1 \vdash \mathrm{fact} : \tau$

There are five typechecking tules can be used. One is (T-EQ), others are the following rules.

For (T-EQ) rule, then there is a $\tau' \equiv \tau$, and $\varnothing; \dot{\Phi}; \Delta; \dot{\Gamma}; B; \mathrm{limit}_1 \vdash \mathrm{fact} : \tau'$,

and we will only use one rule of the following rules.

$case1:\ \ i \mapsto \tau; \dot{\Phi}; \Delta; \dot{\Gamma}; B; \mathrm{limit}_1 \vdash \mathrm{fact} : \mathrm{Has}(i, \tau)$

By (FACT1) rule, $i \mapsto \tau; \dot{\Phi}; \Delta; \dot{\Gamma}; B; \mathrm{limit}_2 \vdash \mathrm{fact} : \mathrm{Has}(i, \tau)$

$case2:\ \ \varnothing; \dot{\Phi}, F^K \stackrel{\wedge}{\mapsto} \mathrm{fun}; \Delta; \dot{\Gamma}; B; \mathrm{limit}_1 \vdash \mathrm{fact} : \mathrm{Gen}(F^K, i)$

By (FACT2) rule, $\varnothing; \dot{\Phi}, F^K \stackrel{\wedge}{\mapsto} \mathrm{fun}; \Delta; \dot{\Gamma}; B; \mathrm{limit}_2 \vdash \mathrm{fact} : \mathrm{Gen}(F^K, i)$

$case3 : \varnothing; \dot{\Phi}; \Delta; \dot{\Gamma}; B; \mathrm{limit}_1 \vdash \mathrm{fact} : \mathrm{Eq}(\tau, \tau)$

By (FACT3) rule, $\varnothing; \dot{\Phi}; \Delta; \dot{\Gamma}; B; \mathrm{limit}_2 \vdash \mathrm{fact} : \mathrm{Eq}(\tau, \tau)$

$case4 : \varnothing; \dot{\Phi}, F^K \stackrel{\cdot}{\mapsto} \mathrm{fun}; \Delta; \dot{\Gamma}; B; \mathrm{limit}_1 \vdash \mathrm{fact} : \mathrm{InDomain}(i, F^K)$

By (FACT4) rule, $\varnothing; \dot{\Phi}, F^K \stackrel{\cdot}{\mapsto} \mathrm{fun}; \Delta; \dot{\Gamma}; B; \mathrm{limit}_2 \vdash \mathrm{fact} : \mathrm{InDomain}(i, F^K)$

5. $s = \Lambda\alpha : K; B.v$

$\Psi; \Phi; \Delta; \Gamma; B_1; \mathrm{limit}_1 \vdash \Lambda\alpha : K; B.v : \tau$

$\Phi; \Delta \vdash B : \mathrm{bool}$

There are two typechecking tules can be used. One is (T-EQ), the other is (T-TABS) rule.

For (T-EQ) rule, then there is a $\tau' \equiv \tau$, and $\Psi; \Phi; \Delta; \Gamma; B_1; \mathrm{limit}_1 \vdash \Lambda\alpha : K; B.v : \tau'$,

and we will only use the (T-TABS) rule.

By (T-TABS) rule, $\tau' = \forall\alpha : K; B.\tau_v$, and $\Psi; \Phi; \Delta, \alpha : K; \Gamma; B_1, B; \mathrm{limit}_1 \vdash v : \tau_v$

By induction, we get $\Psi; \Phi; \Delta, \alpha : K; \Gamma; B_1, B; \mathrm{limit}_2 \vdash v : \tau_v$

Then using (T-TABS) rule, $\Psi;\Phi;\Delta;\Gamma;B_1;\text{limit}_2 \vdash \Lambda\alpha:K;B.v:\forall\alpha:K;B.\tau_v$
By (T-EQ) rule, $\Psi;\Phi;\Delta;\Gamma;B_1;\text{limit}_2 \vdash \Lambda\alpha:K;B.v:\tau$

6. $s = \text{pack}[\tau_1, v]\,\text{as}\,\exists\alpha:K;B.\tau_2$
$\Psi;\Phi;\Delta;\Gamma;B_1;\text{limit}_1 \vdash \text{pack}[\tau_1, v]\,\text{as}\,\exists\alpha:K;B.\tau_2:\tau$
There are two typechecking tules can be used. One is (T-EQ), the other is (T-PACk) rule.
For (T-EQ) rule, then there is a $\tau' \equiv \tau$, and $\Psi;\Phi;\Delta;\Gamma;B_1;\text{limit}_1 \vdash \text{pack}[\tau_1, v]\,\text{as}\,\exists\alpha:K;B.\tau_2:\tau'$,
and we will only use the (T-PACk) rule.
By (T-PACK) rule, we get:
$\tau' = \exists\alpha:K;B.\tau_2$, and $\Phi;\Delta \vdash \tau_1:K$, $\Phi;\Delta \vdash \exists\alpha:K;B.\tau_2 :\overset{\phi}{i}$
$B_1 \vdash [\alpha \mapsto \tau_1]B$, $\Psi;\Phi;\Delta;\Gamma;B_1;\text{limit}_1 \vdash v:[\alpha \mapsto \tau_1]\tau_2$
By induction, we obtain $\Psi;\Phi;\Delta;\Gamma;B_1;\text{limit}_2 \vdash v:[\alpha \mapsto \tau_1]\tau_2$
and by (T-PACK) rule, thus $\Psi;\Phi;\Delta;\Gamma;B_1;\text{limit}_2 \vdash \text{pack}[\tau_1, v]\,\text{as}\,\exists\alpha:K;B.\tau_2:\tau'$
By (T-EQ) rule, $\Psi;\Phi;\Delta;\Gamma;B_1;\text{limit}_2 \vdash \text{pack}[\tau_1, v]\,\text{as}\,\exists\alpha:K;B.\tau_2:\tau$

7. $s = \text{roll}[\tau](v)$ $\tau = (\mu\alpha:K.\tau_0)\tau_1\cdots\tau_n$
By Lemma (6.2.1.(12)), we have $\Psi;\Phi;\Delta;\Gamma;B;\text{limit}_1 \vdash \text{roll}[\tau](v):\tau$
$\Phi;\Delta \vdash \tau :\overset{\phi}{i}$,
$\Psi;\Phi;\Delta;\Gamma;B;\text{limit}_1 \vdash v:([\alpha \mapsto \mu\alpha:K.\tau_0]\tau_0)\tau_1\cdots\tau_n$
By induction, we obtain $\Psi;\Phi;\Delta;\Gamma;B;\text{limit}_2 \vdash v:([\alpha \mapsto \mu\alpha:K.\tau_0]\tau_0)\tau_1\cdots\tau_n$
Then by (T-ROLL) rule, we have
$\Psi;\Phi;\Delta;\Gamma;B;\text{limit}_2 \vdash \text{roll}[\tau](v):\tau$

8. $s = \text{union}(b, \tau_1, \tau_2, v)$
$\Psi;\Phi;\Delta;\Gamma;B;\text{limit}_1 \vdash \text{union}(b, \tau_1, \tau_2, v):\tau$
There are two typechecking tules can be used. One is (T-EQ), the other is (T-UNION) rule.
For (T-EQ) rule, then there is a $\tau' \equiv \tau$, and $\Psi;\Phi;\Delta;\Gamma;B;\text{limit}_1 \vdash \text{union}(b, \tau_1, \tau_2, v):\tau'$,
and we will only use the (T-UNION) rule.
By (T-UNION) rule, we get:
$\Phi;\Delta \vdash \tau_1:K$, $\Phi;\Delta \vdash \tau_2:K$, $\Psi;\Phi;\Delta;\Gamma;B;\text{limit}_1 \vdash v:\tau_i$ $(i = \begin{matrix}1\,if\,b\\2\,if\,\neg b\end{matrix})$
By induction, $\Psi;\Phi;\Delta;\Gamma;B;\text{limit}_2 \vdash v:\tau_i$
By (T-UNION) rule, $\Psi;\Phi;\Delta;\Gamma;B;\text{limit}_2 \vdash \text{union}(b, \tau_1, \tau_2, v):\tau'$
By (T-EQ) rule, thus $\Psi;\Phi;\Delta;\Gamma;B;\text{limit}_2 \vdash \text{union}(b, \tau_1, \tau_2, v):\tau$

9. $s = \phi\langle\overrightarrow{v}\rangle$
$\Psi;\Phi;\Delta;\Gamma;B;\text{limit}_1 \vdash \phi\langle\overrightarrow{v}\rangle:\tau$
By Lemma (6.2.1.(6)), we have $\phi\langle\overrightarrow{\tau'}\rangle \equiv \tau$, and $\forall i.(\Psi_i;\Phi_i;\Delta;\Gamma_i;B;\text{limit}_1 \vdash v_i:\tau_i')$, $\Phi;\Delta \vdash \phi\langle\overrightarrow{\tau'}\rangle:K$
By induction, $\forall i.(\Psi_i;\Phi_i;\Delta;\Gamma_i;B;\text{limit}_2 \vdash v_i:\tau_i')$, then using (T-TUPLE) rule,
$\Psi;\Phi;\Delta;\Gamma;B;\text{limit}_2 \vdash \phi\langle\overrightarrow{v}\rangle:\phi\langle\overrightarrow{\tau'}\rangle$
By (T-EQ) rule, $\Psi;\Phi;\Delta;\Gamma;B;\text{limit}_2 \vdash \phi\langle\overrightarrow{v}\rangle:\tau$

10. $s = \text{fix}\,x:\tau.v$
$\Psi;\Phi;\Delta;\Gamma;B;\text{limit}_1 \vdash \text{fix}\,x:\tau.v:\tau'$
By Lemma (6.2.1.(10)), we know $\tau \equiv \tau'$, and
$\Psi;\Phi;\Delta;\Gamma,x:\tau;B;\text{limit}_1 \vdash v:\tau'$, $\Phi;\Delta \vdash \tau' :\overset{\phi}{i}$
By induction, $\Psi;\Phi;\Delta;\Gamma,x:\tau;B;\text{limit}_2 \vdash v:\tau'$

By (T-FIX) rule, $\Psi; \Phi; \Delta; \Gamma; B; \text{limit}_2 \vdash \text{fix}\, x : \tau.v : \tau'$

6.2.3 LEMMA [ARITHMETIC FORMS]

If $\Phi; \Delta \vdash \tau : \text{bool}$, then $\tau = B$. Proof by induction on the kinding derivation for τ. Crucial case: $\tau = \tau_f\, \tau_a$, where τ_f has kind $K_a \to J_b$ (syntactically, J_b cannot be bool).

6.2.4 LEMMA [TYPE ENVIRONMENT SUBSTITUTION]

If $\Phi; \Delta \vdash \tau : K$, then $([\overrightarrow{\alpha \mapsto \tau_\alpha}]\Phi); \Delta \vdash \tau : K$.

Proof by induction on the kinding derivation. The only kinding rule that uses Φ is (K-FUN), which uses only the domain of Φ, which is unaffected by $[\overrightarrow{\alpha \mapsto \tau_\alpha}]$.

6.2.5 LEMMA [TYPE SUBSTITUTION 1]

If $C, \overrightarrow{\alpha : K_\alpha} \vdash \tau : K$, and $C \vdash \tau_{\alpha_i} : K_{\alpha_i}$, then $C \vdash [\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau : K$.

(Corollary, via the type environment substitution lemma: if $C, \overrightarrow{\alpha : K_\alpha} \vdash \tau : K$, and $C \vdash \tau_{\alpha_i} : K_{\alpha_i}$, then $[\overrightarrow{\alpha \mapsto \tau_\alpha}]C \vdash [\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau : K$.)

Proof by induction on the kinding derivation.

1. $\tau = \beta$

If $\beta = \alpha_i$, then $C, \overrightarrow{\alpha : K_\alpha} \vdash \tau : K$, $K = K_{\alpha_i}$
$[\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau = \tau_{\alpha_i}$, then $C \vdash [\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau : K_{\alpha_i}$

If $\beta \neq \alpha_i$, then $[\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau = \beta$, and because $C, \overrightarrow{\alpha \mapsto \tau_\alpha} \vdash \beta : K$, we know $C(\beta) = K$.
By (K-TVAR) rule, $C \vdash \beta : K$.

2. $\tau = i$

then by (K-IVAR) rule, $\dot{C}, \overrightarrow{\alpha \mapsto \tau_\alpha} \vdash i : \text{int} \Rightarrow \dot{C} \vdash i : \text{int}$
$[\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau = i$, thus $\dot{C} \vdash [\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau : \text{int}$

3. $\tau = \lambda\beta : K_a.\tau_0$ (In this case, we can rename β, then $\alpha \neq \beta$)

By (K-TABS) rule, $C, \overrightarrow{\alpha : K_\alpha} \vdash \lambda\beta : K_a.\tau_0 : K_a \to K_b$, and $C, \beta : K_a, \overrightarrow{\alpha : K_\alpha} \vdash \tau_0 : K_b$
By induction, we obtain:
$(C, \beta : K_a) \vdash [\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau_0 : K_b$
$\Rightarrow C, \beta : K_a \vdash [\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau_0 : K_b$
By (K-TABS) rule,
$C \vdash \lambda\beta : K_a.[\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau_0 : K_a \to K_b$
$\Rightarrow C \vdash [\overrightarrow{\alpha \mapsto \tau_\alpha}]\lambda\beta : K_a.\tau_0 : K_a \to K_b$

4. $\tau = \tau_f \tau_a$

By (K-TAPP) rule, $C, \overrightarrow{\alpha : K_\alpha} \vdash \tau_f \tau_a : K_b$, and $C, \overrightarrow{\alpha : K_\alpha} \vdash \tau_f : K_a \to K_b$, $\quad C, \overrightarrow{\alpha : K_\alpha} \vdash \tau_a : K_a$
By induction, we have
$C \vdash [\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau_f : K_a \to K_b$
$C \vdash [\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau_a : K_a$
By (K-APP) rule,
$C \vdash [\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau_f \tau_a : K_b$

5. $\tau = \forall\beta : K; B.\tau_0$

By (K-ALL) rule, $C, \overrightarrow{\alpha : K_\alpha} \vdash \forall \beta : K; B.\tau_0 :\overset{\phi}{i}$, and
$C, \beta : K, \overrightarrow{\alpha : K_\alpha} \vdash B : \text{bool}, \quad C, \beta : K, \overrightarrow{\alpha : K_\alpha} \vdash \tau_0 :\overset{\phi}{i}$
By induction,
$C, \beta : K \vdash [\overrightarrow{\alpha \mapsto \tau_\alpha}]B : \text{bool}$
$C, \beta : K \vdash [\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau_0 :\overset{\phi}{i}$
By (K-ALL) rule, we obtain
$C \vdash \forall \beta : K; [\overrightarrow{\alpha \mapsto \tau_\alpha}]B.[\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau_0 :\overset{\phi}{i}$
$\Rightarrow C \vdash [\overrightarrow{\alpha \mapsto \tau_\alpha}]\forall \beta : K; B.\tau_0 :\overset{\phi}{i}$

6. $\tau = F^K$
then by (K-FUN) rule, $C, F^K \dot{\mapsto} \delta, \overrightarrow{\alpha \mapsto \tau_\alpha} \vdash F^K : \text{int} \to K$
$[\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau = F^K$,
By (K-FUN) rule,
$C, F^K \dot{\mapsto} \delta \vdash [\overrightarrow{\alpha \mapsto \tau_\alpha}]F^K : \text{int} \to K$

7. In the same way, we can prove the other cases by induction.

6.2.6 LEMMA [TYPE SUBSTITUTION 2]

If $[\overrightarrow{\alpha \mapsto \tau_\alpha}]B_1$ and $[\overrightarrow{\alpha \mapsto \tau_\alpha}]B_2$ are syntactically well-formed and $B_1 \vdash B_2$, then $[\overrightarrow{\alpha \mapsto \tau_\alpha}]B_1 \vdash [\overrightarrow{\alpha \mapsto \tau_\alpha}]B_2$.

Proof: since $B_1 \vdash B_2$ means that $B_1 \Rightarrow B_2$ for all substitutions of integers for integer variables and booleans for boolean variables, $[\overrightarrow{\alpha \mapsto \tau_\alpha}]B_1 \Rightarrow [\overrightarrow{\alpha \mapsto \tau_\alpha}]B_2$ for all remaining substitutions of of integers for integer variables and booleans for boolean variables.

6.2.7 LEMMA [TYPE SUBSTITUTION 3]

If $\Phi; \Delta, \overrightarrow{\alpha : K_\alpha} \vdash \tau_1 : K$ and $\Phi; \Delta, \overrightarrow{\alpha : K_\alpha} \vdash \tau_2 : K$ and $[\overrightarrow{\alpha \mapsto \tau_\alpha}]B$ is syntactically well-formed and $\Phi; B \vdash \tau_1 \equiv \tau_2$, and $C \vdash \tau_{\alpha_i} : K_{\alpha_i}$, then $[\overrightarrow{\alpha \mapsto \tau_\alpha}]\Phi; [\overrightarrow{\alpha \mapsto \tau_\alpha}]B \vdash [\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau_1 \equiv [\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau_2$.

Proof by induction on the type equivalence derivation. Example case:

1. $\frac{B \vdash I \doteq i}{\Phi, \mathrm{F}^K \dot{\mapsto} \delta; B \vdash \mathrm{F}^K I \equiv \delta(i)}$

By type substitution 1, we know $[\overrightarrow{\alpha \mapsto \tau_\alpha}]\Phi; \Delta \vdash [\overrightarrow{\alpha \mapsto \tau_\alpha}](\mathrm{F}^K I) : K$ and $[\overrightarrow{\alpha \mapsto \tau_\alpha}]\Phi; \Delta \vdash [\overrightarrow{\alpha \mapsto \tau_\alpha}]\delta(i) : K$. From this, we know that $[\overrightarrow{\alpha \mapsto \tau_\alpha}]I$ is syntactically well-formed. By type substitution 2, $[\overrightarrow{\alpha \mapsto \tau_\alpha}]B \vdash [\overrightarrow{\alpha \mapsto \tau_\alpha}]I \doteq i$. Knowing this, we can use the type equivalence rule to conclude:

$$\frac{[\overrightarrow{\alpha \mapsto \tau_\alpha}]B \vdash [\overrightarrow{\alpha \mapsto \tau_\alpha}]I \doteq i}{[\overrightarrow{\alpha \mapsto \tau_\alpha}](\Phi, \mathrm{F}^K \dot{\mapsto} \delta); [\overrightarrow{\alpha \mapsto \tau_\alpha}]B \vdash \mathrm{F}^K [\overrightarrow{\alpha \mapsto \tau_\alpha}]I \equiv ([\overrightarrow{\alpha \mapsto \tau_\alpha}]\delta)(i)}$$

6.2.8 LEMMA [TERM SUBSTITUTION]

If we make the following definitions and assumptions:

- We define a substitution $[s] = [\overrightarrow{\alpha \mapsto \tau_\alpha}, \overrightarrow{x \mapsto s_x}, \overrightarrow{y \mapsto s_y}, \overrightarrow{z \mapsto s_z}]$
- $C = \Psi; \Phi; \Delta; \Gamma; B; \text{limit}_C$
- No α_i appears free in $\Psi; \Phi; \Delta$ (note: typically, this condition can be satisfied by alpha-renaming α_i before invoking this lemma).

- $[\overrightarrow{\alpha \mapsto \tau_\alpha}]C = \Psi; \Phi; \Delta; [\overrightarrow{\alpha \mapsto \tau_\alpha}]\Gamma; [\overrightarrow{\alpha \mapsto \tau_\alpha}]B; [\overrightarrow{\alpha \mapsto \tau_\alpha}]\text{limit}_C$ is syntactically well-formed (this assumption is needed because substitutions of non-integers and non-booleans into integers I and booleans B do not always produce integers and booleans).
- $C, \overrightarrow{\alpha : K_\alpha}, \overrightarrow{x : \tau_x}, \overrightarrow{y : \tau_y} \vdash e : \tau$
- $z_i \notin domain(\Gamma)$
- $[\overrightarrow{\alpha \mapsto \tau_\alpha}]\ \dot{C} \vdash s_{x_i} : [\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau_{x_i}$ (where τ_{x_i} are nonlinear types)
- $[\overrightarrow{\alpha \mapsto \tau_\alpha}](\dot{C}, C_{y_i}) \vdash s_{y_i} : [\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau_{y_i}$ (where τ_{y_i} are linear types)
- $[\overrightarrow{\alpha \mapsto \tau_\alpha}](\dot{C}, C_{z_i}) \vdash s_{z_i} : [\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau_{z_i}$ (where τ_{z_i} are linear types)
- $C \vdash \tau_{\alpha_i} : K_{\alpha_i}$

then we can conclude the following:

- $[\overrightarrow{\alpha \mapsto \tau_\alpha}](C, \overrightarrow{C_{y_i}}) \vdash [s]e : [\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau$

Proof by induction on the type derivation. The cases that use induction on an environment with an extended Γ must weaken the s_{x_i}, s_{y_i}, s_{z_i} typings; we write this out explicitly for the $e = \lambda w : \tau \xrightarrow{\phi,\text{limit}} e_0$ case but omit the details in the other cases.

1*a*. $e = x_0$, where $x_0 \neq x_i, y_i, z_i$
$\dot{C}, \overrightarrow{\alpha : K_\alpha}, \overrightarrow{x : \tau_x} \vdash x_0 : \tau$. The $\overrightarrow{y}$ must be empty, and $\dot{C} = C = (C, \overrightarrow{C_{y_i}})$, and $C(x_0) = \tau$.
$[s]e = x_0$
Since $C(x_0) = \tau$, we know $([\overrightarrow{\alpha \mapsto \tau_\alpha}]C)(x_0) = [\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau$.
Thus, $[\overrightarrow{\alpha \mapsto \tau_\alpha}](C, \overrightarrow{C_{y_i}}) \vdash [s]e : [\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau$

1*b*. $e = x_i$
$\tau = \tau_{x_i}$ and $\dot{C}, \overrightarrow{\alpha : K_\alpha}, \overrightarrow{x : \tau_x} \vdash x_0 : \tau_{x_i}$. The $\overrightarrow{y}$ must be empty, and $\dot{C} = C = (C, \overrightarrow{C_{y_i}})$.
$[s]e = s_{x_i}$ and $[\overrightarrow{\alpha \mapsto \tau_\alpha}]C \vdash s_{x_i} : [\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau_{x_i}$.
So $[\overrightarrow{\alpha \mapsto \tau_\alpha}](C, \overrightarrow{C_{y_i}}) \vdash [s]e : [\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau$.

2*a*. $e = y_i$
$\dot{C}, \overrightarrow{\alpha : K_\alpha}, \overrightarrow{x : \tau_x}, y_i : \tau_{y_i} \vdash e : \tau_{y_i}$ and $\tau = \tau_{y_i}$. The $\overrightarrow{y}$ must be empty except for y_i, and $\dot{C} = C$ and $\overrightarrow{C_{y_i}} = C_{y_i}$.
$[s]e = s_{y_i}$ and $[\overrightarrow{\alpha \mapsto \tau_\alpha}](\dot{C}, C_{y_i}) \vdash s_{y_i} : [\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau_{y_i}$,
Thus, $[\overrightarrow{\alpha \mapsto \tau_\alpha}](\dot{C}, C_{y_i}) \vdash [s]e : [\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau$

2*b*. $e = z_i$: cannot happen, because $C, \overrightarrow{\alpha : K_\alpha}, \overrightarrow{x : \tau_x}, \overrightarrow{y : \tau_y} \vdash e : \tau$ and $z_i \notin domain(\Gamma)$

3. $e = e_1 e_2$
$C, \overrightarrow{\alpha : K_\alpha}, \overrightarrow{x : \tau_x}, \overrightarrow{y : \tau_y} \vdash e_1 e_2 : \tau_2$
By Lemma (6.2.1.(2)), we have
$C_1, \overrightarrow{\alpha : K_\alpha}, \overrightarrow{x : \tau_x}, \overrightarrow{y' : \tau_{y'}} \vdash e_1 : \tau_1 \xrightarrow{f} \tau_2 \quad C_2, \overrightarrow{\alpha : K_\alpha}, \overrightarrow{x : \tau_x}, \overrightarrow{y'' : \tau_{y''}} \vdash e_2 : \tau_1$

By induction, we obtain:
$[\overrightarrow{\alpha \mapsto \tau_\alpha}](C_1, \overrightarrow{C_{y_i'}}) \vdash [\overrightarrow{\alpha \mapsto \tau_\alpha}, \overrightarrow{x \mapsto s_x}, \overrightarrow{y' \mapsto s_{y'}}, (\overrightarrow{z \mapsto s_z}, \overrightarrow{y'' \mapsto s_{y''}})]e_1 :$
$[\overrightarrow{\alpha \mapsto \tau_\alpha}](\tau_1 \xrightarrow{f} \tau_2) \Rightarrow [\overrightarrow{\alpha \mapsto \tau_\alpha}](C_1, \overrightarrow{C_{y_i'}}) \vdash [s]e_1 : [\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau_1 \xrightarrow{f} [\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau_2$
$[\overrightarrow{\alpha \mapsto \tau_\alpha}](C_2, \overrightarrow{C_{y_i''}}) \vdash [\overrightarrow{\alpha \mapsto \tau_\alpha}, \overrightarrow{x \mapsto s_x}, \overrightarrow{y'' \mapsto s_{y''}}, (\overrightarrow{z \mapsto s_z}, \overrightarrow{y' \mapsto s_{y'}})]e_2 : [\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau_1$

$\Rightarrow [\overrightarrow{\alpha \mapsto \tau_\alpha}](C_2, \overrightarrow{C_{y_i''}}) \vdash [s]e_2 : [\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau_1$

By (T-APP) rule,
$[\overrightarrow{\alpha \mapsto \tau_\alpha}](C, \overrightarrow{C_{y_i}}) \vdash [s]e_1([s]e_2) : [\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau_2$
$[\overrightarrow{\alpha \mapsto \tau_\alpha}](C, \overrightarrow{C_{y_i}}) \vdash [\overrightarrow{\alpha \mapsto \tau_\alpha}, \overrightarrow{x \mapsto s_x}, \overrightarrow{y \mapsto s_y}, \overrightarrow{z \mapsto s_z}]e : [\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau$

4. $e = \lambda w : \tau \overset{\phi,\text{limit}}{\longrightarrow} e_0$
By Lemma (6.2.1.(3)) and (T-EQ) rule, we have
$C, \overrightarrow{\alpha : K_\alpha}, \overrightarrow{x : \tau_x}, \overrightarrow{y : \tau_y} \vdash \lambda w : \tau_w \overset{\phi,\text{limit}_2}{\longrightarrow} e_0 : \tau_w \overset{\phi,\text{limit}_2}{\longrightarrow} \tau_0$
and $C', w : \tau_w, \overrightarrow{\alpha : K_\alpha}, \overrightarrow{x : \tau_x}, \overrightarrow{y : \tau_y} \vdash e_0 : \tau_0$, $\Phi; \Delta \vdash \tau_w : K$, (Here, $C' = \Psi, \Phi; \Delta; \Gamma; B; \text{limit}_2$)
Applying the limit change lemma to the typings for s_{x_i}, s_{y_i}, s_{z_i} gives:
$[\overrightarrow{\alpha \mapsto \tau_\alpha}]\overset{.}{C}' \vdash s_{x_i} : [\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau_{x_i}$ and $[\overrightarrow{\alpha \mapsto \tau_\alpha}](\overset{.}{C}', C'_{y_i}) \vdash s_{y_i} : [\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau_{y_i}$and $[\overrightarrow{\alpha \mapsto \tau_\alpha}](\overset{.}{C}', C'_{z_i}) \vdash s_{z_i} : [\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau_{z_i}$.
and in $C \vdash \tau_{\alpha_i} : K_{\alpha_i}$,we need $\Phi; \Delta$, then $C' \vdash \tau_{\alpha_i} : K_{\alpha_i}$. (We also use limit_2 in $\overset{.}{C}', C', C'_{y_i}, C'_{z_i}$)
If τ_w is nonlinear, then by type substitution $[\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau_w$ is also nonlinear and so the Weakening Lemma says:
$[\overrightarrow{\alpha \mapsto \tau_\alpha}](\overset{.}{C}', w : \tau_w) \vdash s_{x_i} : [\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau_{x_i}$ and $[\overrightarrow{\alpha \mapsto \tau_\alpha}](\overset{.}{C}', C'_{y_i}, w : \tau_w) \vdash s_{y_i} : [\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau_{y_i}$and $[\overrightarrow{\alpha \mapsto \tau_\alpha}](\overset{.}{C}', C'_{z_i}, w : \tau_w) \vdash s_{z_i} : [\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau_{z_i}$.
If τ_w is linear, weakening is not needed.
By induction, we have:
$[\overrightarrow{\alpha \mapsto \tau_\alpha}](C', \overrightarrow{C'_{y_i}}), w : [\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau_w \vdash [s]e_0 : [\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau_0$
By Type Substitution Lemma we know, $[\overrightarrow{\alpha \mapsto \tau_\alpha}](\Phi; \Delta) \vdash [\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau_w : K$
By (T-ABS) rule, we obtain:
$[\overrightarrow{\alpha \mapsto \tau_\alpha}](C, \overrightarrow{C_{y_i}}) \vdash [s]e : [\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau_w \overset{\phi,\text{limit}_2}{\longrightarrow} [\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau_0$
$[\overrightarrow{\alpha \mapsto \tau_\alpha}](C, \overrightarrow{C_{y_i}}) \vdash [s]e : [\overrightarrow{\alpha \mapsto \tau_\alpha}](\tau_w \overset{\phi,\text{limit}_2}{\longrightarrow} \tau_0)$

5. $e = \text{pack}[\tau_1, e_0] \text{ as } \exists\beta : K; B'.\tau_2$
By Lemma (6.2.1.(14)) and (T-EQ) rule, we have
$C, \overrightarrow{\alpha : K_\alpha}, \overrightarrow{x : \tau_x}, \overrightarrow{y : \tau_y} \vdash \text{pack}[\tau_1, e_0] \text{ as } \exists\beta : K; B'.\tau_2 : \exists\beta : K; B'.\tau_2$, and
$C, \overrightarrow{\alpha : K_\alpha}, \overrightarrow{x : \tau_x}, \overrightarrow{y : \tau_y} \vdash \tau_1 : K \Rightarrow C, \overrightarrow{\alpha : K_\alpha} \vdash \tau_1 : K$,
$C, \overrightarrow{\alpha : K_\alpha}, \overrightarrow{x : \tau_x}, \overrightarrow{y : \tau_y} \vdash [\beta \mapsto \tau_1]B' \Rightarrow C, \overrightarrow{\alpha : K_\alpha} \vdash [\beta \mapsto \tau_1]B'$,
$C, \overrightarrow{\alpha : K_\alpha}, \overrightarrow{x : \tau_x}, \overrightarrow{y : \tau_y} \vdash e_0 : [\beta \mapsto \tau_1]\tau_2$,
$C, \overrightarrow{\alpha : K_\alpha}, \overrightarrow{x : \tau_x}, \overrightarrow{y : \tau_y} \vdash \exists\beta : K; B'.\tau_2 : \overset{\phi}{i} \Rightarrow C, \overrightarrow{\alpha : K_\alpha} \vdash \exists\beta : K; B'.\tau_2 : \overset{\phi}{i}$
By induction, we get:
$[\overrightarrow{\alpha \mapsto \tau_\alpha}](C, \overrightarrow{C_{y_i}}) \vdash [s]e_0 : [\overrightarrow{\alpha \mapsto \tau_\alpha}][\beta \mapsto \tau_1]\tau_2$
$[\overrightarrow{\alpha \mapsto \tau_\alpha}](C, \overrightarrow{C_{y_i}}) \vdash [s]e_0 : [\beta \mapsto \tau_1]([\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau_2)$
By Type Substitution Lemma,
$[\overrightarrow{\alpha \mapsto \tau_\alpha}]C \vdash [\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau_1 : K$,
$[\overrightarrow{\alpha \mapsto \tau_\alpha}]C \vdash [\overrightarrow{\alpha \mapsto \tau_\alpha}](\exists\beta : K; B'.\tau_2) : \overset{\phi}{i}$
$\Rightarrow [\overrightarrow{\alpha \mapsto \tau_\alpha}]C \vdash \exists\beta : K; ([\overrightarrow{\alpha \mapsto \tau_\alpha}]B').[\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau_2 : \overset{\phi}{i}$
$C, \overrightarrow{\alpha : K_\alpha} \vdash \exists\beta : K; B'.\tau_2 : \overset{\phi}{i} \Rightarrow C, \overrightarrow{\alpha : K_\alpha}, \beta : K \vdash B' : \text{bool} \Rightarrow [\beta \mapsto \tau_1]C, \overrightarrow{\alpha : K_\alpha} \vdash [\beta \mapsto \tau_1]B' : \text{bool} \Rightarrow [\overrightarrow{\alpha \mapsto \tau_\alpha}][\beta \mapsto \tau_1]C \vdash [\overrightarrow{\alpha \mapsto \tau_\alpha}][\beta \mapsto \tau_1]B' : \text{bool}$ (this implies that $[\overrightarrow{\alpha \mapsto \tau_\alpha}][\beta \mapsto \tau_1]B'$ is syntactically well-formed)
$[\overrightarrow{\alpha \mapsto \tau_\alpha}]C \vdash [\overrightarrow{\alpha \mapsto \tau_\alpha}][\beta \mapsto \tau_1]B'$
$\Rightarrow [\overrightarrow{\alpha \mapsto \tau_\alpha}]C \vdash [\beta \mapsto [\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau_1]([\overrightarrow{\alpha \mapsto \tau_\alpha}]B')$,
By Weakening Lemma,
$[\overrightarrow{\alpha \mapsto \tau_\alpha}](C, \overrightarrow{C_{y_i}}) \vdash [\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau_1 : K$,

$[\overrightarrow{\alpha \mapsto \tau_\alpha}](C, \overrightarrow{C_{y_i}}) \vdash [\beta \mapsto [\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau_1]([\overrightarrow{\alpha \mapsto \tau_\alpha}]B'),$
$[\overrightarrow{\alpha \mapsto \tau_\alpha}](C, \overrightarrow{C_{y_i}}) \vdash \exists\beta : K; ([\overrightarrow{\alpha \mapsto \tau_\alpha}]B').[\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau_2 :\overset{\phi}{i}$
By (T-PACK) rule,
$[\overrightarrow{\alpha \mapsto \tau_\alpha}](C, \overrightarrow{C_{y_i}}) \vdash \text{pack}[[\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau_1, [s]e_0] \text{ as } \exists\beta : K; [\overrightarrow{\alpha \mapsto \tau_\alpha}]B'.[\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau_2 :$
$\exists\beta : K; [\overrightarrow{\alpha \mapsto \tau_\alpha}]B'.[\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau_2$
Therefore, $[\overrightarrow{\alpha \mapsto \tau_\alpha}](C, \overrightarrow{C_{y_i}}) \vdash$
$[s](\text{pack}[\tau_1, e_0] \text{ as } \exists\beta : K; B'.\tau_2) : [\overrightarrow{\alpha \mapsto \tau_\alpha}]\exists\beta : K; B'.\tau_2$

6. $e = \text{unpack}\,\beta, w = e_1 \text{ in } e_2$
By Lemma (6.2.1.(13)) and (T-EQ) rule, we get
$C, \overrightarrow{\alpha : K_\alpha}, \overrightarrow{x : \tau_x}, \overrightarrow{y : \tau_y} \vdash \text{unpack}\,\beta, w = e_1 \text{ in } e_2 : \tau_2$, and
$C_1, \overrightarrow{\alpha : K_\alpha}, \overrightarrow{x : \tau_x}, \overrightarrow{y' : \tau_{y'}} \vdash e_1 : \exists\beta : K; B'.\tau_1,\ \ C \vdash \tau_2 : K_2$
$C_2, \overrightarrow{\alpha : K_\alpha}, \overrightarrow{x : \tau_x}, \overrightarrow{y'' : \tau_{y''}}, \beta : K, w : \tau_1, B' \vdash e_2 : \tau_2$
By Type Substitution Lemma, $[\overrightarrow{\alpha \mapsto \tau_\alpha}]C \vdash [\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau_2 : K_2$
By Weakening Lemma, $[\overrightarrow{\alpha \mapsto \tau_\alpha}](C, \overrightarrow{C_{y_i'}}) \vdash [\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau_2 : K_2$
By induction, we obtain:
$[\overrightarrow{\alpha \mapsto \tau_\alpha}](C_1, \overrightarrow{C_{y_i'}}) \vdash [\overrightarrow{\alpha \mapsto \tau_\alpha}, \overrightarrow{x \mapsto s_x}, \overrightarrow{y' \mapsto s_{y'}}, \overrightarrow{z \mapsto s_z}, , \overrightarrow{y'' \mapsto s_{y''}}]e_1 : [\overrightarrow{\alpha \mapsto \tau_\alpha}](\exists\beta : K; B'.\tau_1)$
$\Rightarrow [\overrightarrow{\alpha \mapsto \tau_\alpha}](C_1, \overrightarrow{C_{y_i'}}) \vdash [s]e_1 : \exists\beta : K; [\overrightarrow{\alpha \mapsto \tau_\alpha}]B'.[\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau_1$ (this also proves that $[\overrightarrow{\alpha \mapsto \tau_\alpha}]B'$ is syntactically well-formed).
$[\overrightarrow{\alpha \mapsto \tau_\alpha}](C_2, \overrightarrow{C_{y_i''}}, \beta : K, w : \tau_1, B') \vdash [\overrightarrow{\alpha \mapsto \tau_\alpha}, \overrightarrow{x \mapsto s_x}, \overrightarrow{y'' \mapsto s_{y''}}, \overrightarrow{z \mapsto s_z}, , \overrightarrow{y' \mapsto s_{y'}}]e_2 : [\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau_2$
$\Rightarrow [\overrightarrow{\alpha \mapsto \tau_\alpha}](C_2, \overrightarrow{C_{y_i''}}), \beta : K, w : [\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau_1, [\overrightarrow{\alpha \mapsto \tau_\alpha}]B' \vdash [s]e_2 : [\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau_2$
By (T-UNPACK) rule, $[\overrightarrow{\alpha \mapsto \tau_\alpha}](C, \overrightarrow{C_{y_i}}) \vdash$
$\text{unpack}\,\beta, w = [s]e_1 \text{ in } [s]e_2 : [\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau_2$
$[\overrightarrow{\alpha \mapsto \tau_\alpha}](C, \overrightarrow{C_{y_i}}) \vdash [s](\text{unpack}\,\beta, w = e_1 \text{ in } e_2) : [\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau_2$

7. $e = \text{fix}\, w : \tau.v$
By Lemma (6.2.1.(10)) and (T-EQ) rule, we get
$C, \overrightarrow{\alpha : K_\alpha}, \overrightarrow{x : \tau_x}, \overrightarrow{y : \tau_y} \vdash \text{fix}\, w : \tau.v : \tau$, and $C, \overrightarrow{\alpha : K_\alpha}, \overrightarrow{x : \tau_x}, \overrightarrow{y : \tau_y}, w : \tau \vdash v : \tau$
$C, \overrightarrow{\alpha : K_\alpha}, \overrightarrow{x : \tau_x}, \overrightarrow{y : \tau_y} \vdash \tau :\overset{\phi}{i} \Rightarrow C, \overrightarrow{\alpha : K_\alpha} \vdash \tau :\overset{\phi}{i}$
By induction,
$[\overrightarrow{\alpha \mapsto \tau_\alpha}](C, \overrightarrow{C_{y_i}}, w : \tau) \vdash [s]v : [\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau$
$\Rightarrow [\overrightarrow{\alpha \mapsto \tau_\alpha}](C, \overrightarrow{C_{y_i}}), w : [\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau \vdash [s]v : [\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau$
By Type Substitution Lemma,
$[\overrightarrow{\alpha \mapsto \tau_\alpha}]C \vdash [\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau :\overset{\phi}{i}$
By Weakening Lemma,
$[\overrightarrow{\alpha \mapsto \tau_\alpha}](C, \overrightarrow{C_{y_i}}) \vdash [\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau :\overset{\phi}{i}$
By (T-FIX) rule,
$[\overrightarrow{\alpha \mapsto \tau_\alpha}](C, \overrightarrow{C_{y_i}}) \vdash \text{fix}\, w : [\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau.[\overrightarrow{\alpha \mapsto \tau_\alpha}, \overrightarrow{x \mapsto s_x}, \overrightarrow{y \mapsto s_y}, \overrightarrow{z \mapsto s_z}]v : [\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau$
$[\overrightarrow{\alpha \mapsto \tau_\alpha}](C, \overrightarrow{C_{y_i}}) \vdash [\overrightarrow{\alpha \mapsto \tau_\alpha}, \overrightarrow{x \mapsto s_x}, \overrightarrow{y \mapsto s_y}, \overrightarrow{z \mapsto s_z}](\text{fix}\, w : \tau.v) : [\overrightarrow{\alpha \mapsto \tau_\alpha}]\tau$

8. In the same way, we can prove the other cases by induction.

6.2.9 THEOREM [PRESERVATION]

If $\Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash e : \tau$, $\Psi_{spare}, \Psi_e; \Phi_{spare}, \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash (M, e : \tau)$ and $(M, e) \rightarrow (M', e')$, then $\Psi'_e; \Phi'_e; \Delta; \Gamma; B; \text{limit} \vdash e' : \tau$ and $\Psi_{spare}, \Psi'_e; \Phi_{spare}, \Phi'_e; \Delta; \Gamma; B; \text{limit} \vdash (M', e' : \tau)$, where $(\Phi'_e \dot{\supseteq} \Phi_e)$.

Prove by induction on the type derivation. The cases below omit most of the congruence rule cases, because the proofs for these all look more or less the same. See the tuple, load, and store cases for examples of the proofs for congruence rule cases.

1. $Case T - VAR$: $e = x$
There are no evaluation rules for variables

2. $Case T - ABS$: $e = \lambda x : \tau_1 \overset{\phi,\text{limit}}{\longrightarrow} e_0$
There are no evaluation rules for e (e is value)

3. $Case T - TABS$: $e = \Lambda\alpha : K; B.v$
There are no evaluation rules for e (e is value)

4. $Case T - APP$: $e = e_1\, e_2 \qquad \Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit}_C \vdash e : \tau$
From lemma 6.2.1.(2), there is τ_1 and
$\Psi_{e_1}; \Phi_{e_1}; \Delta; \Gamma_{e_1}; B; \text{limit}_C \vdash e_1 : \tau_1 \overset{limit_f}{\longrightarrow} \tau'$,
($\text{limit}_C = \text{limit}_f = \infty$) or ($\text{limit}_f < \text{limit}_C$) or ($\text{limit}_C = \infty$, $\text{limit}_f = I$, $\Phi_e; \Delta \vdash \tau' \overset{\phi}{:} 0$)
$\Psi_{e_2}; \Phi_{e_2}; \Delta; \Gamma_{e_2}; B; \text{limit}_C \vdash e_2 : \tau_1, \quad \tau' \equiv \tau$

($E - APPABS1$)
$e_1 = \lambda x : \tau_x \overset{\phi,I}{\longrightarrow} e_{12} \qquad e_2 = v_2 \qquad e' = \text{coerce}([x \mapsto v_2]e_{12})$
By Lemma 6.2.1.(3), $\tau_1 \equiv \tau_x$, and $\Psi_{e_1}; \Phi_{e_1}; \Delta; \Gamma_{e_1}, x : \tau_x; B; I \vdash e_{12} : \tau'$
By (T-EQ) rule, $\Psi_{e_2}; \Phi_{e_2}; \Delta; \Gamma_{e_2}; B; \text{limit}_C \vdash e_2 : \tau_x$
By Limit-Change Lemma, $\Psi_{e_2}; \Phi_{e_2}; \Delta; \Gamma_{e_2}; B; I \vdash e_2 : \tau_x$
Using Substitution Lemma, we get $\Psi_e; \Phi_e; \Delta; \Gamma; B; I \vdash [x \mapsto v_2]e_{12} : \tau'$
Because ($I < \text{limit}_C$) or ($\text{limit}_C = \infty$, $\Phi_e; \Delta \vdash \tau' \overset{\phi'}{:} 0$),
by (T-COERCE) rule, $\Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit}_C \vdash \text{coerce}([x \mapsto v_2]e_{12}) : \tau'$
By (T-EQ) rule, $\Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit}_C \vdash e' : \tau$
Because $\Psi_{spare}, \Psi_e; \Phi_{spare}, \Phi_e; \Delta; \Gamma; B; \text{limit}_C \vdash (M, e : \tau)$
And we don't change M, then $M' = M$
$\forall i \in dom(\Psi).(\varnothing; \dot{\Phi}; \varnothing; \varnothing; true; \infty \vdash M'(i) : \Psi(i))$
Thus, $\Psi_{spare}, \Psi'_e; \Phi_{spare}, \Phi'_e; \Delta; \Gamma; B; \text{limit}_C \vdash (M', e' : \tau)$
$\Psi'_e = \Psi_e;\ \Phi'_e = \Phi_e;\ M' = M$

($E - APPABS2$)
$e_1 = \lambda x : \tau_x \overset{\phi,\infty}{\longrightarrow} e_{12} \qquad e_2 = v_2 \qquad e' = [x \mapsto v_2]e_{12}$
By Lemma 6.2.1.(3), $\tau_1 \equiv \tau_x$, and $\Psi_{e_1}; \Phi_{e_1}; \Delta; \Gamma_{e_1}, x : \tau_x; B; \infty \vdash e_{12} : \tau'$
By (T-EQ) rule, $\Psi_{e_2}; \Phi_{e_2}; \Delta; \Gamma_{e_2}; B; \text{limit}_C \vdash e_2 : \tau_x$
By Limit-Change Lemma, $\Psi_{e_2}; \Phi_{e_2}; \Delta; \Gamma_{e_2}; B; \infty \vdash e_2 : \tau_x$
Using Substitution Lemma, we get $\Psi_e; \Phi_e; \Delta; \Gamma; B; \infty \vdash [x \mapsto v_2]e_{12} : \tau'$
Because ($\text{limit}_C = \text{limit}_f = \infty$),
By (T-EQ) rule, $\Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit}_C \vdash e' : \tau$
Because $\Psi_{spare}, \Psi_e; \Phi_{spare}, \Phi_e; \Delta; \Gamma; B; \text{limit}_C \vdash (M, e : \tau)$
And we don't change M, then $M' = M$
$\forall i \in dom(\Psi).(\varnothing; \dot{\Phi}; \varnothing; \varnothing; true; \infty \vdash M'(i) : \Psi(i))$
Thus, $\Psi_{spare}, \Psi'_e; \Phi_{spare}, \Phi'_e; \Delta; \Gamma; B; \text{limit}_C \vdash (M', e' : \tau)$

$\Psi'_e = \Psi_e;\ \Phi'_e = \Phi_e;\ M' = M$

5. $CaseT - TAPP$: $e = e_1\tau_2 \qquad \Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash e_1\tau_2 : \tau$
By Lemma 6.2.1.(4), there is $[\alpha \mapsto \tau'_2]\,\tau'_1 \equiv \tau;\ \tau'_2 \equiv \tau_2,\ \Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash e_1\tau_2 : [\alpha \mapsto \tau'_2]\,\tau'_1$
and $\Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash e_1 : \forall\alpha : K; B.\tau'_1$,
$\Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash \tau'_2 : K \qquad$ and $\Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash [\alpha \mapsto \tau'_2]B$

$(E - TAPPTABS)$
$e_1 = \Lambda\alpha : K'; B.v, \qquad e' = [\alpha \mapsto \tau_2]v,$
Because $\tau'_2 \equiv \tau_2$, then $e' = [\alpha \mapsto \tau'_2]v$
By Lemma 6.2.1.(5), $K' = K, \quad \Psi_e; \Phi_e; \Delta, \alpha : K'; \Gamma; B; \text{limit} \vdash v : \tau'_1$
Thus,$\Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash \tau'_2 : K'; \quad \Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash e_1 : \forall\alpha : K'; B.\tau'_1$
By Term Substitution lemma, we get $[\alpha \mapsto \tau'_2](\Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit}) \vdash [\alpha \mapsto \tau'_2]v : [\alpha \mapsto \tau'_2]\tau'_1$
Because α doesn't appear in $\Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit}$, and by (T-EQ) rule, $\Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash e' : \tau$
Because $\Psi_{spare}, \Psi_e; \Phi_{spare}, \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash (M, e : \tau)$
And we don't change M, then $M' = M$
$\forall i \in dom(\Psi).(\varnothing; \dot{\Phi}; \varnothing; \varnothing; true; \infty \vdash M'(i) : \Psi(i))$
Thus, $\Psi_{spare}, \Psi'_e; \Phi_{spare}, \Phi'_e; \Delta; \Gamma; B; \text{limit} \vdash (M', e' : \tau)$
$\Psi'_e = \Psi_e;\ \Phi'_e = \Phi_e;\ M' = M$

6. $CaseT - TUPLE$: $e = \phi\langle\overrightarrow{e}\rangle \qquad \Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash \phi\langle\overrightarrow{e}\rangle : \tau$
By Lemma 6.2.1.(6), $\Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash \phi\langle\overrightarrow{e}\rangle : \phi\langle\overrightarrow{\tau'}\rangle$, and $\phi\langle\overrightarrow{\tau'}\rangle \equiv \tau$,
and $\forall i.(\Psi_{e_i}; \Phi_{e_i}; \Delta; \Gamma_{e_i}; B; \text{limit} \vdash e_i : \tau_i) \quad \Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash \phi\langle\overrightarrow{\tau'}\rangle : K$
Suppose, $e_k \to e'_k$ now.
Because $\Psi_{spare}, \Psi_e; \Phi_{spare}, \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash (M, \phi\langle\overrightarrow{e}\rangle : \phi\langle\overrightarrow{\tau'}\rangle)$,
then $\forall i \in dom(\Psi).(\varnothing; \dot{\Phi}; \varnothing; \varnothing; true; \infty \vdash M(i) : \Psi(i))$
and $\Psi_{e_k}; \Phi_{e_k}; \Delta; \Gamma_{e_k}; B; \text{limit} \vdash e_k : \tau'_k$
Thus, $\Psi'_{spare}, \Psi_{e_k}; \Phi'_{spare}, \Phi_{e_k}; \Delta; \Gamma_{e_k}; B; \text{limit} \vdash (M, e_k : \tau'_k)$
By induction, we obtain $\Psi'_{e_k}; \Phi'_{e_k}; \Delta; \Gamma_{e_k}; B; \text{limit} \vdash e'_k : \tau'_k \quad (\Phi'_{e_k} \dot{\supseteq} \Phi_{e_k})$
and $\Psi'_{spare}, \Psi'_{e_k}; \Phi'_{spare}, \Phi'_{e_k}; \Delta; \Gamma_{e_k}; B; \text{limit} \vdash (M', e'_k : \tau'_k)$
(Here, $\forall i \in dom(\Psi').(\varnothing; \dot{\Phi}'; \varnothing; \varnothing; true; \infty \vdash M'(i) : \Psi'(i))$)
and $\Psi'_{spare} = \Psi_{spare}, \Psi_{e_1}, \cdots \Psi_{e_{k-1}}, \Psi_{e_{k+1}}, \cdots \Psi_{e_n};\ \Phi'_{spare} = \Phi_{spare}, \Phi_{e_1}, \cdots \Phi_{e_{k-1}}, \Phi_{e_{k+1}}, \cdots \Phi_{e_n}$
For the other e_j,
$\Psi_{e_j}; \Phi_{e_j}; \Delta; \Gamma_{e_j}; B; \text{limit} \vdash e_j : \tau'_j$

Given $C = \Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit}$ and $C = C_1, ..., C_n$ and $C'_k \dot{\supseteq} C_k$, by the split subset lemma, we can find a $C'_1, \ldots, C'_n = \Psi'_e; \Phi'_e; \Delta; \Gamma; B; \text{limit} = C' \dot{\supseteq} C$ so that for all $j \neq k$, $C'_j \supseteq C_j$. We then use weakening to show $C'_j \vdash e_j : \tau'_j$. Then using the (T-TUPLE) rule, we get:
$\Psi'_e; \Phi'_e; \Delta; \Gamma; B; \text{limit} \vdash \phi\langle\overrightarrow{e'}\rangle : \phi\langle\overrightarrow{\tau'}\rangle$
By (T-EQ), we obtain $\Psi'_e; \Phi'_e; \Delta; \Gamma; B; \text{limit} \vdash \phi\langle\overrightarrow{e'}\rangle : \tau$
Using (T-MEM) rule,
$\Psi_{spare}, \Psi'_e; \Phi_{spare}, \Phi'_e; \Delta; \Gamma; B; \text{limit} \vdash (M', \phi\langle\overrightarrow{e'}\rangle : \tau)$

7. $CaseT - LET$: $\quad e = \text{let}\,\langle\overrightarrow{x}\rangle = e_a\,\text{in}\,e_b$
$\Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash \phi\langle\overrightarrow{e}\rangle : \tau$
By Lemma 6.2.1.(7), there is $\tau'_b \equiv \tau. \quad \Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash \text{let}\,\langle\overrightarrow{x}\rangle = e_a\,\text{in}\,e_b : \tau'_b$
and $\Psi_{e_a}; \Phi_{e_a}; \Delta; \Gamma_{e_a}; B; \text{limit} \vdash e_a : \phi\langle\overrightarrow{\tau'}\rangle, \quad \Psi_{e_b}; \Phi_{e_b}; \Delta; \Gamma_{e_b}, \overrightarrow{x : \tau'}; B; \text{limit} \vdash e_b : \tau'_b$

$(E-LET)$
$e_a = \phi\langle v_1, \cdots, v_n\rangle, \quad \Psi_{e_a}; \Phi_{e_a}; \Delta; \Gamma_{e_a}; B; \text{limit} \vdash \phi\langle v_1, \cdots, v_n\rangle : \phi\langle \tau'_1, \cdots, \tau'_n\rangle,$
$e' = [x_1 \mapsto v_1, \cdots, x_n \mapsto v_n]e_b$
By Lemma 6.2.1.(6), there is $\phi\langle \tau''_1, \cdots, \tau''_n\rangle \equiv \phi\langle \tau'_1, \cdots, \tau'_n\rangle$
and $\forall i.(\Psi_{e_{a_i}}; \Phi_{e_{a_i}}; \Delta; \Gamma_{e_{a_i}}; B; \text{limit} \vdash v_i : \tau''_i)$
By (T-EQ), $\forall i.(\Psi_{e_{a_i}}; \Phi_{e_{a_i}}; \Delta; \Gamma_{e_{a_i}}; B; \text{limit} \vdash v_i : \tau'_i)$
Because $\Psi_{e_b}; \Phi_{e_b}; \Delta; \Gamma_{e_b}, \overrightarrow{x : \tau'}; B; \text{limit} \vdash e_b : \tau'_b$
By substitution lemma, we obtain
$\Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash [x_1 \mapsto v_1, \cdots, x_n \mapsto v_n]e_b : \tau'_b$
By (T-EQ), $\Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash e' : \tau$
Because $\Psi_{spare}, \Psi_e; \Phi_{spare}, \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash (M, e : \tau)$
And we don't change M, then $M' = M$
$\forall i \in dom(\Psi).(\varnothing; \dot{\Phi}'; \varnothing; \varnothing; true; \infty \vdash M'(i) : \Psi(i))$
Thus, $\Psi_{spare}, \Psi'_e; \Phi_{spare}, \Phi'_e; \Delta; \Gamma; B; \text{limit} \vdash (M', e' : \tau)$
$\Psi'_e = \Psi_e;\ \Phi'_e = \Phi_e;\ M' = M$

8. $Case\, T-LOAD$: $e = \text{load}(e_{\text{ptr}}, e_{\text{Has}})$
$\Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash \text{load}(e_{\text{ptr}}, e_{\text{Has}}) : \tau$
By Lemma 6.2.1.(8), $^\wedge\langle \tau', \text{Has}(I, \tau')\rangle \equiv \tau$
and $\Psi_{e_{\text{ptr}}}; \Phi_{e_{\text{ptr}}}; \Delta; \Gamma_{e_{\text{ptr}}}; B; \text{limit} \vdash e_{\text{ptr}} : \text{Int}(I)$
$\Psi_{e_{\text{Has}}}; \Phi_{e_{\text{Has}}}; \Delta; \Gamma_{e_{\text{Has}}}; B; \text{limit} \vdash e_{\text{Has}} : \text{Has}(I, \tau')$

$(E-LOAD)$
$e_{\text{ptr}} = i$, $e_{\text{Has}} = \text{fact}$, and $e' =^\wedge \langle M(i), \text{fact}\rangle$
$\varnothing; \dot{\Phi}_{e_{\text{ptr}}}; \Delta; \dot{\Gamma}_{e_{\text{ptr}}}; B; \text{limit} \vdash e_{\text{ptr}} : \text{Int}(I)$
$\{i \mapsto \tau'\}; \dot{\Phi}_{e_{\text{Has}}}; \Delta; \dot{\Gamma}_{e_{\text{Has}}}; B; \text{limit} \vdash e_{\text{Has}} : \text{Has}(I, \tau')$
$\{i \mapsto \tau'\}; \dot{\Phi}_e; \Delta; \dot{\Gamma}; B; \text{limit} \vdash e :^\wedge \langle \tau', \text{Has}(I, \tau')\rangle$
By (T-MEM) rule and Weakening Lemma,
$\varnothing; \dot{\Phi}_e; \Delta; \dot{\Gamma}; \text{true}; \text{limit} \vdash M(i) : \tau'$
$\{i \mapsto \tau'\}; \dot{\Phi}_{e_{\text{Has}}}; \Delta; \dot{\Gamma}_{e_{\text{Has}}}; B; \text{limit} \vdash \text{fact} : \text{Has}(I, \tau')$
By (T-TUPLE) rule,
$\{i \mapsto \tau'\}; \dot{\Phi}_e; \Delta; \dot{\Gamma}; B; \text{limit} \vdash^\wedge \langle M(i), \text{fact}\rangle :^\wedge \langle \tau', \text{Has}(I, \tau')\rangle$
By (T-EQ) rule,
$\{i \mapsto \tau'\}; \dot{\Phi}_e; \Delta; \dot{\Gamma}; B; \text{limit} \vdash e' : \tau$
Because $\Psi_{spare}, \Psi_e; \Phi_{spare}, \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash (M, e : \tau)$
And we don't change M, then $M' = M$
$\forall i \in dom(\Psi).(\varnothing; \dot{\Phi}'; \varnothing; \varnothing; true; \infty \vdash M'(i) : \Psi(i))$
Thus, $\Psi_{spare}, \Psi'_e; \Phi_{spare}, \Phi'_e; \Delta; \Gamma; B; \text{limit} \vdash (M', e' : \tau)$
$\Psi'_e = \Psi_e;\ \Phi'_e = \Phi_e;\ M' = M$

$(E-LOAD1) \quad e_{\text{ptr}} \to e'_{\text{ptr}}$
Because $\Psi_{spare}, \Psi_e; \Phi_{spare}, \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash (M, \text{load}(e_{\text{ptr}}, e_{\text{Has}}) :^\wedge \langle \tau', \text{Has}(I, \tau')\rangle)$
then $\forall i \in dom(\Psi).(\varnothing; \dot{\Phi}; \varnothing; \varnothing; true; \infty \vdash M(i) : \Psi(i))$
Thus, by Lemma 6.2.1.(8) and (T-EQ) rule,
$\Psi_{e_{\text{ptr}}}; \Phi_{e_{\text{ptr}}}; \Delta; \Gamma_{e_{\text{ptr}}}; B; \text{limit} \vdash e_{\text{ptr}} : \text{Int}(I)$
$\Rightarrow \Psi'_{spare}, \Psi_{e_{\text{ptr}}}; \Phi'_{spare}, \Phi_{e_{\text{ptr}}}; \Delta; \Gamma_{e_{\text{ptr}}}; B; \text{limit} \vdash (M, e_{\text{ptr}} : \text{Int}(I))$
$(\Psi'_{spare} = \Psi_{spare}, \Psi_{e_{\text{Has}}};\ \Phi'_{spare} = \Phi_{spare}, \Phi_{e_{\text{Has}}})$
By induction, we obtain $\Psi'_{e_{\text{ptr}}}; \Phi'_{e_{\text{ptr}}}; \Delta; \Gamma_{e_{\text{ptr}}}; B; \text{limit} \vdash e'_{\text{ptr}} : \text{Int}(I) \quad (\Phi_{e_{\text{ptr}}} \dot{\supseteq} \Phi_{e_{\text{ptr}}})$
and $\Psi'_{spare}, \Psi'_{e_{\text{ptr}}}; \Phi'_{spare}, \Phi'_{e_{\text{ptr}}}; \Delta; \Gamma_{e_{\text{ptr}}}; B; \text{limit} \vdash (M', e'_{\text{ptr}} : \text{Int}(I))$

$\Rightarrow \Psi_{spare}, \Psi_{e_{\text{Has}}}, \Psi'_{e_{\text{ptr}}}; \Phi_{spare}, \Phi_{e_{\text{Has}}}, \Phi'_{e_{\text{ptr}}}; \Delta; \Gamma_{e_{\text{ptr}}}; B; \text{limit} \vdash (M', e'_{\text{ptr}} : \text{Int}(I))$

(Here, $\forall i \in dom(\Psi').(\varnothing; \dot{\Phi}'; \varnothing; \varnothing; true; \infty \vdash M'(i) : \Psi'(i))$)

We still have $\Psi_{e_{\text{Has}}}; \Phi_{e_{\text{Has}}}; \Delta; \Gamma_{e_{\text{Has}}}; B; \text{limit} \vdash e_{\text{Has}} : \text{Has}(I, \tau')$

Given $C = \Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit}$ and $C = C_{ptr}, C_{Has}$ and $C'_{ptr} \dot{\supseteq} C_{ptr}$, by the split subset lemma, we can find a $C'_{ptr}, C'_{Has} = \Psi'_e; \Phi'_e; \Delta; \Gamma; B; \text{limit} = C' \dot{\supseteq} C$ so that $C'_{Has} \supseteq C_{Has}$. We then use weakening to show $C'_{Has} \vdash e_{Has} : \text{Has}(I, \tau')$. Then using the (T-LOAD) rule, we have:

$\Psi'_e; \Phi'_e; \Delta; \Gamma; B; \text{limit} \vdash \text{load}(e'_{\text{ptr}}, e_{\text{Has}}) :^\wedge \langle \tau', \text{Has}(I, \tau') \rangle$

By (T-EQ), we obtain $\Psi'_e; \Phi'_e; \Delta; \Gamma; B; \text{limit} \vdash \text{load}(e'_{\text{ptr}}, e_{\text{Has}}) : \tau$

BY (T-MEM) rule,

$\Psi_{spare}, \Psi'_e; \Phi_{spare}, \Phi'_e; \Delta; \Gamma; B; \text{limit} \vdash (M', \text{load}(e'_{\text{ptr}}, e_{\text{Has}}) : \tau)$

$(E - LOAD2)$ $e_{\text{Has}} \rightarrow e'_{\text{Has}}$

Because $\Psi_{spare}, \Psi_e; \Phi_{spare}, \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash (M, \text{load}(v_{\text{ptr}}, e'_{\text{Has}}) :^\wedge \langle \tau', \text{Has}(I, \tau') \rangle)$

then $\forall i \in dom(\Psi).(\varnothing; \dot{\Phi}; \varnothing; \varnothing; true; \infty \vdash M(i) : \Psi(i))$

Thus, by Lemma 6.2.1.(8) and (T-EQ) rule,

$\Psi_{e_{\text{Has}}}; \Phi_{e_{\text{Has}}}; \Delta; \Gamma_{e_{\text{Has}}}; B; \text{limit} \vdash e_{e_{\text{Has}}} : \text{Has}(I, \tau')$

$\Rightarrow \Psi'_{spare}, \Psi_{e_{\text{Has}}}; \Phi'_{spare}, \Phi_{e_{\text{Has}}}; \Delta; \Gamma_{e_{\text{Has}}}; B; \text{limit} \vdash (M, e_{\text{Has}} : \text{Has}(I, \tau'))$

$(\Psi'_{spare} = \Psi_{spare}, \Psi_{v_{\text{ptr}}};\ \Phi'_{spare} = \Phi_{spare}, \Phi_{v_{\text{ptr}}})$

By induction, we obtain $\Psi'_{e_{\text{Has}}}; \Phi'_{e_{\text{Has}}}; \Delta; \Gamma_{e_{\text{Has}}}; B; \text{limit} \vdash e'_{\text{Has}} : \text{Has}(I, \tau')$ $(\Phi_{e_{\text{Has}}} \dot{\supseteq} \Phi_{e_{\text{Has}}})$

and $\Psi'_{spare}, \Psi'_{e_{\text{Has}}}; \Phi'_{spare}, \Phi'_{e_{\text{Has}}}; \Delta; \Gamma_{e_{\text{Has}}}; B; \text{limit} \vdash (M', e'_{\text{Has}} : \text{Has}(I, \tau'))$

$\Rightarrow \Psi_{spare}, \Psi_{v_{\text{ptr}}}, \Psi'_{e_{\text{Has}}}; \Phi_{spare}, \Phi_{v_{\text{ptr}}}, \Phi'_{e_{\text{Has}}}; \Delta; \Gamma_{e_{\text{Has}}}; B; \text{limit} \vdash (M', e'_{\text{Has}} : \text{Has}(I, \tau'))$

(Here, $\forall i \in dom(\Psi').(\varnothing; \dot{\Phi}'; \varnothing; \varnothing; true; \infty \vdash M'(i) : \Psi'(i))$)

We still have $\Psi_{v_{\text{ptr}}}; \Phi_{v_{\text{ptr}}}; \Delta; \Gamma_{v_{\text{ptr}}}; B; \text{limit} \vdash v_{\text{ptr}} : \text{Int}(I)$

Given $C = \Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit}$ and $C = C_{ptr}, C_{Has}$ and $C'_{Has} \dot{\supseteq} C_{Has}$, by the split subset lemma, we can find a $C'_{ptr}, C'_{Has} = \Psi'_e; \Phi'_e; \Delta; \Gamma; B; \text{limit} = C' \dot{\supseteq} C$ so that $C'_{ptr} \supseteq C_{ptr}$. We then use weakening to show $C'_{ptr} \vdash v_{ptr} : \text{Int}(I)$. Then using the (T-LOAD) rule, we have:

$\Psi'_e; \Phi'_e; \Delta; \Gamma; B; \text{limit} \vdash \text{load}(v_{\text{ptr}}, e'_{\text{Has}}) :^\wedge \langle \tau', \text{Has}(I, \tau') \rangle$

By (T-EQ), we obtain $\Psi'_e; \Phi'_e; \Delta; \Gamma; B; \text{limit} \vdash \text{load}(v_{\text{ptr}}, e'_{\text{Has}}) : \tau$

BY (T-MEM) rule,

$\Psi_{spare}, \Psi'_e; \Phi_{spare}, \Phi'_e; \Delta; \Gamma; B; \text{limit} \vdash (M', \text{load}(v_{\text{ptr}}, e'_{\text{Has}}) : \tau)$

9. $Case\ T - STORE$: $e = \text{store}(e_{\text{ptr}}, e_{\text{Has}}, e_{\text{v}})$

$\Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash \text{store}(e_{\text{ptr}}, e_{\text{Has}}, e_{\text{v}}) : \tau$

By Lemma 6.2.1.(9), there is $\tau \equiv \text{Has}(I, \tau_2)$, and

$\Psi_{e_{\text{ptr}}}; \Phi_{e_{\text{ptr}}}; \Delta; \Gamma_{e_{\text{ptr}}}; B; \text{limit} \vdash e_{\text{ptr}} : \text{Int}(I)$

$\Psi_{e_{\text{has}}}; \Phi_{e_{\text{has}}}; \Delta; \Gamma_{e_{\text{has}}}; B; \text{limit} \vdash e_{\text{has}} : \text{Has}(I, \tau_1)$

$\Psi_{e_{\text{v}}}; \Phi_{e_{\text{v}}}; \Delta; \Gamma_{e_{\text{v}}}; B; \text{limit} \vdash e_{\text{v}} : \tau_2,\ \Phi; \Delta \vdash \tau_2 :\dot{1}$

$(E - STORE)$

$e = \text{store}(i, \text{fact}, v)$, and

$\varnothing; \dot{\Phi}_{e_{\text{ptr}}}; \Delta; \dot{\Gamma}_{e_{\text{ptr}}}; B; \text{limit} \vdash e_{\text{ptr}} : \text{Int}(I)$

$\{i \mapsto \tau_1\}; \dot{\Phi}_{e_{\text{has}}}; \Delta; \dot{\Gamma}_{e_{\text{has}}}; B; \text{limit} \vdash e_{\text{has}} : \text{Has}(I, \tau_1)$

$\varnothing; \dot{\Phi}_{e_{\text{v}}}; \Delta; \dot{\Gamma}_{e_{\text{v}}}; B; \text{limit} \vdash e_{\text{v}} : \tau_2,\ (\Phi; \Delta \vdash \tau_2 :\dot{1})$

$\{i \mapsto \tau_1\}; \dot{\Phi}_e; \Delta; \dot{\Gamma}; B; \text{limit} \vdash \text{store}(e_{\text{ptr}}, e_{\text{Has}}, e_{\text{v}}) : \text{Has}(I, \tau_2)$

$e' = \text{fact}$, by (T-FACT1) rule,

$\{i \mapsto \tau_2\}; \dot{\Phi}_e; \Delta; \dot{\Gamma}; B; \text{limit} \vdash \text{fact} : \text{Has}(I, \tau_2)$

$\{i \mapsto \tau_2\}; \dot{\Phi}_e; \Delta; \dot{\Gamma}; B; \text{limit} \vdash e' : \tau$

Because $\Psi_{spare}, \Psi_e; \Phi_{spare}, \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash (M, e : \tau)$
And $M' = [i \mapsto v]M,\ \Psi' = [i \mapsto \tau_2]\Psi$
$\forall i \in dom(\Psi).(\varnothing; \dot{\Phi}'; \varnothing; \varnothing; true; \infty \vdash M'(i) : \Psi'(i))$
Thus, $\Psi_{spare}, \Psi'_e; \Phi_{spare}, \Phi'_e; \Delta; \Gamma; B; \text{limit} \vdash (M', e' : \tau)$
$\Psi'_e = [i \mapsto \tau_2]\Psi_e;\ \Phi'_e = \Phi_e;\ M' = [i \mapsto v]M$

$(E - STORE1)\quad e_{\text{ptr}} \to e'_{\text{ptr}}$
Because $\Psi_{spare}, \Psi_e; \Phi_{spare}, \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash (M, \text{store}(e_{\text{ptr}}, e_{\text{Has}}, e_{\text{v}}) : \text{Has}(I, \tau_2))$
then $\forall i \in dom(\Psi).(\varnothing; \dot{\Phi}; \varnothing; \varnothing; true; \infty \vdash M(i) : \Psi(i))$
Thus, by Lemma 6.2.1.(9) and (T-EQ) rule,
$\Psi_{e_{\text{ptr}}}; \Phi_{e_{\text{ptr}}}; \Delta; \Gamma_{e_{\text{ptr}}}; B; \text{limit} \vdash e_{\text{ptr}} : \text{Int}(I)$
$\Rightarrow \Psi'_{spare}, \Psi_{e_{\text{ptr}}}; \Phi'_{spare}, \Phi_{e_{\text{ptr}}}; \Delta; \Gamma_{e_{\text{ptr}}}; B; \text{limit} \vdash (M, e_{\text{ptr}} : \text{Int}(I))$
$(\Psi'_{spare} = \Psi_{spare}, \Psi_{e_{\text{Has}}}, \Psi_{e_{\text{v}}};\ \Phi'_{spare} = \Phi_{spare}, \Phi_{e_{\text{Has}}}, \Phi_{e_{\text{v}}})$
By induction, we obtain $\Psi'_{e_{\text{ptr}}}; \Phi'_{e_{\text{ptr}}}; \Delta; \Gamma_{e_{\text{ptr}}}; B; \text{limit} \vdash e'_{\text{ptr}} : \text{Int}(I) \quad (\Phi_{e_{\text{ptr}}} \dot{\supseteq} \Phi_{e_{\text{ptr}}})$
and $\Psi'_{spare}, \Psi'_{e_{\text{ptr}}}; \Phi'_{spare}, \Phi'_{e_{\text{ptr}}}; \Delta; \Gamma_{e_{\text{ptr}}}; B; \text{limit} \vdash (M', e'_{\text{ptr}} : \text{Int}(I))$
$\Rightarrow \Psi_{spare}, \Psi_{e_{\text{Has}}}, \Psi'_{e_{\text{ptr}}}, \Psi_{e_{\text{v}}}; \Phi_{spare}, \Phi_{e_{\text{Has}}}, \Phi'_{e_{\text{ptr}}}, \Phi_{e_{\text{v}}}; \Delta; \Gamma_{e_{\text{ptr}}}; B; \text{limit} \vdash (M', e'_{\text{ptr}} : \text{Int}(I))$
(Here, $\forall i \in dom(\Psi').(\varnothing; \dot{\Phi}'; \varnothing; \varnothing; true; \infty \vdash M'(i) : \Psi'(i))$))
We still have $\Psi_{e_{\text{has}}}; \Phi_{e_{\text{has}}}; \Delta; \Gamma_{e_{\text{has}}}; B; \text{limit} \vdash e_{\text{has}} : \text{Has}(I, \tau_1)$
$\Psi_{e_{\text{v}}}; \Phi_{e_{\text{v}}}; \Delta; \Gamma_{e_{\text{v}}}; B; \text{limit} \vdash e_{\text{v}} : \tau_2$
Given $C = \Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit}$ and $C = C_{ptr}, C_{Has}, C_v$ and $C'_{ptr} \dot{\supseteq} C_{ptr}$, by the split subset lemma, we can find a $C'_{ptr}, C'_{Has}, C'_v = \Psi'_e; \Phi'_e; \Delta; \Gamma; B; \text{limit} = C' \dot{\supseteq} C$ so that $C'_{Has} \supseteq C_{Has}$ and $C'_v \supseteq C_v$. We then use weakening to show $C'_{Has} \vdash e_{\text{has}} : \text{Has}(I, \tau_1)$ and $C'_v \vdash e_v : \tau_2$. Then using the (T-STORE) rule, we have:
$\Psi'_e; \Phi'_e; \Delta; \Gamma; B; \text{limit} \vdash \text{store}(e_{\text{ptr}}, e_{\text{Has}}, e_{\text{v}}) : \text{Has}(I, \tau_2)$
By (T-EQ), we obtain $\Psi'_e; \Phi'_e; \Delta; \Gamma; B; \text{limit} \vdash \text{store}(e_{\text{ptr}}, e_{\text{Has}}, e_{\text{v}}) : \tau$
BY (T-MEM) rule,
$\Psi_{spare}, \Psi'_e; \Phi_{spare}, \Phi'_e; \Delta; \Gamma; B; \text{limit} \vdash (M', \text{store}(e_{\text{ptr}}, e_{\text{Has}}, e_{\text{v}}) : \tau)$

10. $Case\ T - FIX$: $\quad e = \text{fix}\, x : \tau_x.v$
$\Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit}_C \vdash \text{fix}\, x : \tau_x.v : \tau$
By Lemma 6.2.1.(10), there is $\tau_x \equiv \tau$
and $\Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit}_C \vdash \text{fix}\, x : \tau_x.v : \tau$
$\Psi_e; \Phi_e; \Delta; \Gamma, x : \tau_x; B; \text{limit}_C \vdash v : \tau$
$\Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit}_C \vdash \tau : \overset{\phi}{i}$

$(E - FIX)$
$e' = [x \mapsto \text{fix}\, x : \tau_x.v]v$
and $\Psi_e; \Phi_e; \Delta; \Gamma, x : \tau_x; B; \text{limit}_C \vdash v : \tau$
By substitution lemma, we obtain
$\Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit}_C \vdash [x \mapsto \text{fix}\, x : \tau_x.v]v : \tau$
Thus $\Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit}_C \vdash e' : \tau$
We don't change M, then $M' = M$
$\forall i \in dom(\Psi).(\varnothing; \dot{\Phi}'; \varnothing; \varnothing; true; \infty \vdash M'(i) : \Psi(i))$
Thus, $\Psi_{spare}, \Psi'_e; \Phi_{spare}, \Phi'_e; \Delta; \Gamma; B; \text{limit} \vdash (M', e' : \tau)$
$\Psi'_e = \Psi_e;\ \Phi'_e = \Phi_e;\ M' = M$

11. $Case\ T - UNROLL$: $\quad e = \text{unroll}(e_0) \quad \Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash \text{unroll}(e_0) : \tau$
By Lemma 6.2.1.(11), there is $([\alpha \mapsto \mu\alpha : K.\tau_0]\tau_0)\tau_1 \cdots \tau_n \equiv \tau$, $\tau' = (\mu\alpha : K.\tau_0)\tau_1 \cdots \tau_n$

and $\Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash \tau' : K$, $\Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash e_0 : \tau'$

$(E - UNROLL)$
$e_0 = \text{roll}[\tau''](v)$ $e' = v$
$\Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash \text{roll}[\tau''](v) : \tau'$
By Lemma 6.2.1.(12), we know $\tau'' \equiv \tau' \equiv (\mu\beta : K.\tau_{roll})\tau_1 \cdots \tau_n$, (so $\tau_0 \equiv \tau_{roll}$)
and $\Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash \tau_{roll} : K$ $\Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash v : ([\beta \mapsto \mu\beta : K.\tau_{roll}]\tau_{roll})\tau_1 \cdots \tau_n$
By (T-EQ) rule, $\Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash v : ([\alpha \mapsto \mu\alpha : K.\tau_0]\tau_0)\tau_1 \cdots \tau_n$
By (T-EQ) rule again, we have $\Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash e' : \tau$
Because $\Psi_{spare}, \Psi_e; \Phi_{spare}, \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash (M, e : \tau)$
And we don't change M, then $M' = M$
$\forall i \in dom(\Psi).(\varnothing; \dot{\Phi}'; \varnothing; \varnothing; true; \infty \vdash M'(i) : \Psi(i))$
Thus, $\Psi_{spare}, \Psi'_e; \Phi_{spare}, \Phi'_e; \Delta; \Gamma; B; \text{limit} \vdash (M', e' : \tau)$
$\Psi'_e = \Psi_e;\ \Phi'_e = \Phi_e;\ M' = M$

12. $Case T - UNPACK$: $e = \text{unpack}\,\alpha, x = e_1 \,\text{in}\, e_2$
$\Psi_e; \Phi_e; \Delta; \Gamma; B_e; \text{limit} \vdash \text{unpack}\,\alpha, x = e_1 \,\text{in}\, e_2 : \tau$
By Lemma 6.2.1.(13), there is $\tau_2 \equiv \tau$,
$\Psi_{e_1}; \Phi_{e_1}; \Delta; \Gamma_{e_1}; B; \text{limit} \vdash e_1 : \exists\alpha : K; B'.\tau_1$
$\Psi_{e_2}; \Phi_{e_2}; \Delta, \alpha : K; \Gamma_{e_2}, x : \tau_1; B, B'; \text{limit} \vdash e_2 : \tau_2$

$(E - UNPACK)$
$e_1 = \text{pack}[\tau_0, v] \,\text{as}\, \exists\beta : K'; \tau_B.\tau'_1$ $e' = [\alpha \mapsto \tau_0, x \mapsto v]e_2$
$\Psi_{e_1}; \Phi_{e_1}; \Delta; \Gamma_{e_1}; B; \text{limit} \vdash \text{pack}[\tau_0, v] \,\text{as}\, \exists\beta : K'; \tau_B.\tau'_1 : \exists\alpha : K; B'.\tau_1$
By Lemma 6.2.1.(14), then $\tau'_1 \equiv \tau_1$, $\tau_B \equiv B'$ and, $K' \equiv K$,
$\exists\beta : K'; \tau_B.\tau'_1 \equiv \exists\alpha : K; B'.\tau_1$
$\Psi_{e_1}; \Phi_{e_1}; \Delta; \Gamma_{e_1}; B; \text{limit} \vdash \tau_0 : K$ $B \vdash [\alpha \mapsto \tau_0]\tau_B$
$\Psi_{e_1}; \Phi_{e_1}; \Delta; \Gamma_{e_1}; B; \text{limit} \vdash v : [\alpha \mapsto \tau_0]\tau'_1$
By (T-EQ), $\Psi_{e_1}; \Phi_{e_1}; \Delta; \Gamma_{e_1}; B; \text{limit} \vdash v : [\alpha \mapsto \tau_0]\tau_1$
Because $\Psi_{e_2}; \Phi_{e_2}; \Delta, \alpha : K; \Gamma_{e_2}, x : \tau_1; B, B'; \text{limit} \vdash e_2 : \tau_2$,
by Term Substitution Lemma for α,
$[\alpha \mapsto \tau_0](\Psi_{e_2}; \Phi_{e_2}; \Delta; \Gamma_{e_2}, x : \tau_1; B, B'; \text{limit}) \vdash [\alpha \mapsto \tau_0]e_2 : [\alpha \mapsto \tau_0]\tau_2$
$\Rightarrow \Psi_{e_2}; \Phi_{e_2}; \Delta; \Gamma_{e_2}; B, [\alpha \mapsto \tau_0]B'; \text{limit}, x : [\alpha \mapsto \tau_0]\tau_1 \vdash [\alpha \mapsto \tau_0]e_2 : [\alpha \mapsto \tau_0]\tau_2$
$\Rightarrow \Psi_{e_2}; \Phi_{e_2}; \Delta; \Gamma_{e_2}; B; \text{limit}, x : [\alpha \mapsto \tau_0]\tau_1 \vdash [\alpha \mapsto \tau_0]e_2 : [\alpha \mapsto \tau_0]\tau_2$
by Term Substitution Lemma for v,
$\Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash [\alpha \mapsto \tau_0, x \mapsto v]e_2 : [\alpha \mapsto \tau_0]\tau_2$
$\Rightarrow \Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash [\alpha \mapsto \tau_0, x \mapsto v]e_2 : \tau_2$
Thus $\Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash e' : \tau_2$
By (T-EQ) tule, $\Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash e' : \tau$
Because $\Psi_{spare}, \Psi_e; \Phi_{spare}, \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash (M, e : \tau)$
And we don't change M, then $M' = M$
$\forall i \in dom(\Psi).(\varnothing; \dot{\Phi}; \varnothing; \varnothing; true; \infty \vdash M'(i) : \Psi(i))$
Thus, $\Psi_{spare}, \Psi'_e; \Phi_{spare}, \Phi'_e; \Delta; \Gamma; B; \text{limit} \vdash (M', e' : \tau)$
$\Psi'_e = \Psi_e;\ \Phi'_e = \Phi_e;\ M' = M$

13. $Case T - DISTINGUISH$: $e = \text{distinguish}(I_1, I_2, e_1, e_2)$
$\Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash \text{distinguish}(I_1, I_2, e_1, e_2) : \tau$
By Lemma 6.2.1.(15), we get $^\wedge\langle \text{Know}(I_1 \neq I_2), \text{Has}(I_1, \tau_1), \text{Has}(I_2, \tau_2)\rangle \equiv \tau$,
and $\Psi_{e_1}; \Phi_{e_1}; \Delta; \Gamma_{e_1}; B; \text{limit} \vdash e_1 : \text{Has}(I_1, \tau_1)$
$\Psi_{e_2}; \Phi_{e_2}; \Delta; \Gamma_{e_2}; B; \text{limit} \vdash e_2 : \text{Has}(I_2, \tau_2)$

$\Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash I_1 : \text{int} \quad \Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash I_2 : \text{int}$

$(E - DISTINGUISH)$
Then $e_1 = fact_1, \ e_2 = fact_2$, $e' =^\wedge \langle \text{know}(I_1 \neq I_2), fact_1, fact_2 \rangle$
From definition, $\text{know}(I_1 \neq I_2) = \text{pack}[\text{true}, \cdot\langle\rangle] \text{ as } \exists\alpha : \text{bool}; I_1 \neq I_2. \cdot \langle\rangle$
Because by (K-TUPLE) $\Phi_e; \Delta \vdash \text{true} : \text{bool}$,
and by (K-SOME) $\Phi_e; \Delta \vdash \exists\alpha : \text{bool}; I_1 \neq I_2. \cdot \langle\rangle \dot{:} 0$
by (T-TUPLE) $\varnothing; \dot{\Phi}_e; \Delta; \dot{\Gamma}; B; \text{limit} \vdash \cdot\langle\rangle : \cdot\langle\rangle$
$\Rightarrow \varnothing; \dot{\Phi}_e; \Delta; \dot{\Gamma}; B; \text{limit} \vdash \cdot\langle\rangle : [\alpha \mapsto \cdot\langle\rangle] \cdot \langle\rangle$,
and $\Phi_e; \Delta \vdash [\alpha \mapsto \cdot\langle\rangle](I_1 \neq I_2)$
By (T-PACK) rule,
$\varnothing; \Phi_e; \Delta; \dot{\Gamma}; B; \text{limit} \vdash \text{pack}[\text{true}, \cdot\langle\rangle] \text{ as } \exists\alpha : \text{bool}; I_1 \neq I_2. \cdot \langle\rangle : \exists\alpha : \text{bool}; I_1 \neq I_2. \cdot \langle\rangle$
Using abbreviations, $\varnothing; \Phi_e; \Delta; \dot{\Gamma}; B; \text{limit} \vdash \text{know}(I_1 \neq I_2) : \text{Know}(I_1 \neq I_2)$
and $\Psi_{e_1}; \Phi_{e_1}; \Delta; \Gamma_{e_1}; B; \text{limit} \vdash e_1 : \text{Has}(I_1, \tau_1)$
$\Psi_{e_2}; \Phi_{e_2}; \Delta; \Gamma_{e_2}; B; \text{limit} \vdash e_2 : \text{Has}(I_2, \tau_2)$
By (T-TUPLE) rule , we obtain:
$\Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash^\wedge \langle \text{know}(I_1 \neq I_2), fact_1, fact_2 \rangle :^\wedge \langle \text{Know}(I_1 \neq I_2), \text{Has}(I_1, \tau_1), \text{Has}(I_2, \tau_2) \rangle$
Thus, $\Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash e' : \tau$
Because $\Psi_{spare}, \Psi_e; \Phi_{spare}, \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash (M, e : \tau)$
And we don't change M, then $M' = M$
$\forall i \in dom(\Psi).(\varnothing; \dot{\Phi}'; \varnothing; \varnothing; true; \infty \vdash M'(i) : \Psi(i))$
Thus, $\Psi_{spare}, \Psi'_e; \Phi_{spare}, \Phi'_e; \Delta; \Gamma; B; \text{limit} \vdash (M', e' : \tau)$
$\Psi'_e = \Psi_e; \ \Phi'_e = \Phi_e; \ M' = M$

14. $Case\, T - NEWFUN$: $\quad e = \text{new\_fun}(J)$
$\varnothing; \dot{\Phi}_e; \Delta; \dot{\Gamma}; B; \text{limit} \vdash \text{new\_fun}(J) : \tau$
By Lemma 6.2.1.(16), then $\exists\alpha : \text{int} \to J.\text{Gen}(\alpha, 0) \equiv \tau$
and $\varnothing; \dot{\Phi}_e; \Delta; \dot{\Gamma}; B; \text{limit} \vdash \text{new\_fun}(J) : \exists\alpha : \text{int} \to J.\text{Gen}(\alpha, 0)$

$(E - NEWFUN)$
$e' = \text{pack}[F^J, \text{fact}] \text{ as } \exists\alpha : \text{int} \to J.\text{Gen}(\alpha, 0)$
By (T-FACT2) rule, we have $\varnothing; \dot{\Phi}_e, F^J \stackrel{\wedge}{\mapsto} \text{fun}; \Delta; \dot{\Gamma}; B; \text{limit} \vdash \text{fact} : \text{Gen}(F^J, 0)$
By (K-FUN) rule, $\Phi_e, F^J \dot{\mapsto} \text{fun}; \Delta \vdash F^J : \text{int} \to J$
Because $\Phi_e; \Delta \vdash 0 : \text{int}$, and $\Phi_e, F^J \dot{\mapsto} \text{fun}; \Delta, \alpha : \text{int} \to J \vdash \alpha : \text{int} \to J$
By (K-FUNGEN) rule, $\Phi_e, F^J \dot{\mapsto} \text{fun}; \Delta \vdash \text{Gen}(\alpha, 0) \stackrel{\wedge}{:} 0$
By (K-SOME) rule, we obtain $\Phi_e, F^J \dot{\mapsto} \text{fun}; \Delta \vdash \exists\alpha : \text{int} \to J.\text{Gen}(\alpha, 0) \stackrel{\wedge}{:} 0$
By (T-PACK) rule, we get
$\varnothing; \Phi_e, F^J \stackrel{\wedge}{\mapsto} \text{fun}; \Delta; \dot{\Gamma}; B; \text{limit} \vdash \text{pack}[F^J, \text{fact}] \text{ as } \exists\alpha : \text{int} \to J.\text{Gen}(\alpha, 0) : \exists\alpha : \text{int} \to J.\text{Gen}(\alpha, 0)$
Thus, $\varnothing; \Phi_e, F^J \stackrel{\wedge}{\mapsto} \text{fun}; \Delta; \dot{\Gamma}; B; \text{limit} \vdash e' : \exists\alpha : \text{int} \to J.\text{Gen}(\alpha, 0)$
By (T-EQ) rule, $\varnothing; \Phi_e, F^J \stackrel{\wedge}{\mapsto} \text{fun}; \Delta; \dot{\Gamma}; B; \text{limit} \vdash e' : \tau$
Because $\Psi_{spare}, \Psi_e; \Phi_{spare}, \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash (M, e : \tau)$
We don't change M, then $M' = M$
$\forall i \in dom(\Psi).(\varnothing; \dot{\Phi}'; \varnothing; \varnothing; true; \infty \vdash M'(i) : \Psi(i))$
Now $\Phi'_e \dot{\supseteq} \Phi_e$, $\Psi'_e = \Psi_e$; from (T-NEWFUN) we know F^J is fresh.
Thus, $\Psi_{spare}, \Psi'_e; \Phi_{spare}, \Phi'_e; \Delta; \Gamma; B; \text{limit} \vdash (M', e' : \tau)$

15. $Case T-DEFINEFUN$: $e = \text{define\_fun}(e_0, \tau_a)$.
$\Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash \text{define\_fun}(e_0, \tau_a) : \tau$
By Lemma 6.2.1.(17), then $\hat{}\langle \text{Gen}(\tau_f, I+1), \text{Eq}(\tau_f I, \tau_a), \text{InDomain}(I, \tau_f)\rangle \equiv \tau$
and $\Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash e_0 : \text{Gen}(\tau_f, I)$
$\Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash \tau_f : \text{int} \to J$
$\Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash \tau_a : J$

$(E-DEFINEFUN)$
$e_0 = \text{fact}$, then $\varnothing; \dot{\Phi}_e, \tau_f \overset{\hat{}}{\mapsto} \text{fun}; \Delta; \dot{\Gamma}; B; \text{limit} \vdash e_0 : \text{Gen}(\tau_f, I)$
and $\varnothing; \dot{\Phi}_e, \tau_f \overset{\hat{}}{\mapsto} \text{fun}; \Delta; \dot{\Gamma}; B; \text{limit} \vdash \text{define\_fun}(e_0, \tau_a) : \tau$
$\varnothing; \dot{\Phi}_e, \tau_f \overset{\hat{}}{\mapsto} \text{fun}; \Delta; \dot{\Gamma}; B; \text{limit} \vdash \tau_f : \text{int} \to J$
$\varnothing; \dot{\Phi}_e, \tau_f \overset{\hat{}}{\mapsto} \text{fun}; \Delta; \dot{\Gamma}; B; \text{limit} \vdash \tau_a : J$
Now, $e' =^{\wedge} \langle \text{fact}, \text{fact}, \text{fact}\rangle$, $(\text{fun}' \supseteq \text{fun})$
By (T-FACT2) rule, $\varnothing; \dot{\Phi}_e, \tau_f \overset{\hat{}}{\mapsto} \text{fun}'; \Delta; \dot{\Gamma}; B; \text{limit} \vdash \text{fact} : \text{Gen}(\tau_f, I+1)$
By (T-FACT3) rule, $\varnothing; \dot{\Phi}_e, \tau_f \dot{\mapsto} \text{fun}; \Delta; \dot{\Gamma}; B; \text{limit} \vdash \text{fact} : \text{Eq}(\tau_f I, \tau_a)$
By weakening lemma, $\varnothing; \dot{\Phi}_e, \tau_f \dot{\mapsto} \text{fun}'; \Delta; \dot{\Gamma}; B; \text{limit} \vdash \text{fact} : \text{Eq}(\tau_f I, \tau_a)$
By (T-FACT4) rule, $\varnothing; \dot{\Phi}_e, \tau_f \dot{\mapsto} \text{fun}; \Delta; \dot{\Gamma}; B; \text{limit} \vdash \text{fact} : \text{InDomain}(I, \tau_f)$
By weakening lemma, $\varnothing; \dot{\Phi}_e, \tau_f \dot{\mapsto} \text{fun}'; \Delta; \dot{\Gamma}; B; \text{limit} \vdash \text{fact} : \text{InDomain}(I, \tau_f)$
By (T-TUPLE) rule, we obtain $\varnothing; \dot{\Phi}_e, \tau_f \overset{\hat{}}{\mapsto} \text{fun}'; \Delta; \dot{\Gamma}; B; \text{limit} \vdash$
$\hat{}\langle \text{fact}, \text{fact}, \text{fact}\rangle :^{\wedge} \langle \text{Gen}(\tau_f, I+1), \text{Eq}(\tau_f I, \tau_a), \text{InDomain}(I, \tau_f)\rangle$
By (T-EQ) rule, $\varnothing; \dot{\Phi}_e, \tau_f \overset{\hat{}}{\mapsto} \text{fun}'; \Delta; \dot{\Gamma}; B; \text{limit} \vdash e' : \tau$
Because $\Psi_{spare}, \Psi_e; \Phi_{spare}, \Phi_e, \tau_f \overset{\hat{}}{\mapsto} \text{fun}; \Delta; \Gamma; B; \text{limit} \vdash (M, e : \tau)$
And we don't change M, then $M' = M$
$\forall i \in dom(\Psi).(\varnothing; \dot{\Phi}'; \varnothing; \varnothing; true; \infty \vdash M'(i) : \Psi(i))$
Now $\Phi'_e \dot{\supseteq} \Phi_e, \tau_f \overset{\hat{}}{\mapsto} \text{fun}$; $\Psi'_e = \Psi_e$;
By (T-MEM), $\Psi_{spare}, \Psi'_e; \Phi_{spare}, \Phi'_e; \Delta; \Gamma; B; \text{limit} \vdash (M', e' : \tau)$

16. $Case T-DISCARDFUN$: $e = \text{discard\_fun}(e_0)$.
$\Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash \text{discard\_fun}(e_0) : \tau'$
By Lemma 6.2.1.(18), then $\tau' \equiv \cdot\langle\rangle$
and $\Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash e_0 : \text{Gen}(\tau, I)$

$(E-DISCARD)$
$e_0 = \text{fact}$, then $\varnothing; \dot{\Phi}_{e_0}, \tau \overset{\hat{}}{\mapsto} \text{fun}; \Delta; \dot{\Gamma}; B; \text{limit} \vdash e_0 : \text{Gen}(\tau, I)$
$\varnothing; \dot{\Phi}_{e_0}, \tau \overset{\hat{}}{\mapsto} \text{fun}; \Delta; \dot{\Gamma}; B; \text{limit} \vdash \text{define\_fun}(e_0, \tau_a) : \tau$
Now $e' = \cdot\langle\rangle$, and by (T-TUPLE) rule $\dot{C} \vdash \cdot\langle\rangle : \cdot\langle\rangle$
Thus, $\varnothing; \dot{\Phi}_{e_0}, \tau \dot{\mapsto} \text{fun}; \Delta; \dot{\Gamma}; B; \text{limit} \vdash \cdot\langle\rangle : \cdot\langle\rangle$
By (T-EQ) rule, we obtain $\varnothing; \dot{\Phi}_{e_0}, \tau \dot{\mapsto} \text{fun}; \Delta; \dot{\Gamma}; B; \text{limit} \vdash \cdot\langle\rangle : \tau$
Because $\Psi_{spare}, \Psi_e; \Phi_{spare}, \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash (M, e : \tau)$
We don't change M, then $M' = M$
$\forall i \in dom(\Psi).(\varnothing; \dot{\Phi}'; \varnothing; \varnothing; true; \infty \vdash M'(i) : \Psi(i))$
Now $\Phi'_e \dot{\supseteq} \Phi_e$, $\Psi'_e = \Psi_e$;
Thus, $\Psi_{spare}, \Psi'_e; \Phi_{spare}, \Phi'_e; \Delta; \Gamma; B; \text{limit} \vdash (M', e' : \tau)$

17. $Case T-INDOMAIN$: $e = \text{in\_domain}(I_1, I_2, e_1, e_2)$

$\Psi_e; \Phi_e; \Delta; \Gamma_e; B; \text{limit} \vdash \text{in\_domain}(I_1, I_2, e_1, e_2) : \tau$
By Lemma 6.2.1.(19), then $^\wedge\langle \text{Know}(0 \le I_1 \wedge I_1 < I_2), \text{Gen}(\tau_f, I_2)\rangle \equiv \tau$
and $\Psi_e; \Phi_e; \Delta; \Gamma_e; B; \text{limit} \vdash I_1 : \text{int}, \quad \Psi_e; \Phi_e; \Delta; \Gamma_e; B; \text{limit} \vdash I_2 : \text{int}$
$\Psi_{e_1}; \Phi_{e_1}; \Delta; \Gamma_{e_1}; B; \text{limit} \vdash e_1 : \text{InDomain}(I_1, \tau_f)$
$\Psi_{e_1}; \Phi_{e_1}; \Delta; \Gamma_{e_1}; B; \text{limit} \vdash e_2 : \text{Gen}(\tau_f, I_2)$

$(E - INDOMAIN)$
$e_1 = \text{fact}_1$, $e_2 = \text{fact}_2$ then
$\varnothing; \dot{\Phi}_{e_1}, \tau_f \dot{\mapsto} \text{fun}; \Delta; \dot{\Gamma}_{e_1}; B; \text{limit} \vdash e_1 : \text{InDomain}(I_1, \tau_f)$
$\varnothing; \dot{\Phi}_{e_2}, \tau_f \dot{\overset{\wedge}{\mapsto}} \text{fun}; \Delta; \dot{\Gamma}_{e_2}; B; \text{limit} \vdash e_2 : \text{Gen}(\tau_f, I_2)$
$\varnothing; \dot{\Phi}_{e_0}, \tau_f \dot{\overset{\wedge}{\mapsto}} \text{fun}; \Delta; \dot{\Gamma}_e; B; \text{limit} \vdash e : \tau$
$e' =^\wedge \langle \text{know}(0 \le I_1 \wedge I_1 < I_2), \text{fact}\rangle$
By (T-FACT2) rule, we get $\varnothing; \dot{\Phi}_{e_0}, \tau_f \dot{\overset{\wedge}{\mapsto}} \text{fun}; \Delta; \dot{\Gamma}_e; B; \text{limit} \vdash \text{fact} : \text{Gen}(\tau_f, I_2)$
From definition, we $\text{know}(0 \le I_1 \wedge I_1 < I_2) = \text{pack}[\text{true}, \cdot\langle\rangle] \text{ as } \exists\alpha : \text{bool}; 0 \le I_1 \wedge I_1 < I_2. \cdot \langle\rangle$
Because by (K-BOOL) $\dot{\Phi}_{e_0}, \tau_f \dot{\mapsto} \text{fun}; \Delta \vdash \text{true} : \text{bool}$,
and by (K-SOME) $\dot{\Phi}_{e_0}, \tau_f \dot{\mapsto} \text{fun}; \Delta \vdash \exists\alpha : \text{bool}; 0 \le I_1 \wedge I_1 < I_2. \cdot \langle\rangle \dot{:} 0$
$\varnothing; \dot{\Phi}_{e_0}, \tau_f \dot{\mapsto} \text{fun}; \Delta; \dot{\Gamma}_e; B; \text{limit} \vdash \cdot\langle\rangle : [\alpha \mapsto \text{true}] \cdot \langle\rangle$,
and $B \vdash [\alpha \mapsto \text{true}](0 \le I_1 \wedge I_1 < I_2)$
By (T-PACK) rule, we obtain:
$\varnothing; \dot{\Phi}_{e_0}, \tau_f \dot{\mapsto} \text{fun}; \Delta; \dot{\Gamma}_e; B; \text{limit} \vdash \text{pack}[\text{true}, \cdot\langle\rangle] \text{ as } \exists\alpha : \text{bool}; 0 \le I_1 \wedge I_1 < I_2. \cdot \langle\rangle : \exists\alpha : \text{bool}; 0 \le I_1 \wedge I_1 < I_2. \cdot \langle\rangle$
By using abbreviations, $\varnothing; \dot{\Phi}_{e_0}, \tau_f \dot{\overset{\wedge}{\mapsto}} \text{fun}; \Delta; \dot{\Gamma}_e; B; \text{limit} \vdash \text{know}(0 \le I_1 \wedge I_1 < I_2) : \text{Know}(0 \le I_1 \wedge I_1 < I_2)$

By (T-TUPLE) rule, we obtain:
$\varnothing; \dot{\Phi}_{e_0}, \tau_f \dot{\overset{\wedge}{\mapsto}} \text{fun}; \Delta; \dot{\Gamma}_e; B; \text{limit} \vdash^\wedge \langle \text{know}(0 \le I_1 \wedge I_1 < I_2), \text{fact}\rangle :^\wedge \langle \text{Know}(0 \le I_1 \wedge I_1 < I_2), \text{Gen}(\tau_f, I_2)\rangle$
Then, $\varnothing; \dot{\Phi}_{e_0}, \tau_f \dot{\overset{\wedge}{\mapsto}} \text{fun}; \Delta; \dot{\Gamma}_e; B; \text{limit} \vdash e' :^\wedge \langle \text{Know}(0 \le I_1 \wedge I_1 < I_2), \text{Gen}(\tau_f, I_2)\rangle$
By (T-EQ) rule, $\varnothing; \dot{\Phi}_{e_0}, \tau_f \dot{\overset{\wedge}{\mapsto}} \text{fun}; \Delta; \dot{\Gamma}_e; B; \text{limit} \vdash e' : \tau$
Because $\Psi_{spare}, \Psi_e; \Phi_{spare}, \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash (M, e : \tau)$
Here we don't change M, then $M' = M$
$\forall i \in dom(\Psi).(\varnothing; \dot{\Phi}'; \varnothing; \varnothing; true; \infty \vdash M'(i) : \Psi(i))$
Thus, $\Psi_{spare}, \Psi'_e; \Phi_{spare}, \Phi'_e; \Delta; \Gamma; B; \text{limit} \vdash (M', e' : \tau)$
$\Psi'_e = \Psi_e;\ \Phi'_e = \Phi_e;\ M' = M$

18. $Case\, T - MAKEEQ$: $\quad e = \text{make\_eq}(\tau_0)$
$\varnothing; \dot{\Phi}_e; \Delta; \dot{\Gamma}; B; \text{limit} \vdash \text{make\_eq}(\tau_0) : \tau$
By Lemma 6.2.1.(20), then $\text{Eq}(\tau_0, \tau_0) \equiv \tau$ and $\Phi_e; \Delta \vdash \tau_0 : K$

$(E - MAKEEQ)$
$e' = \text{fact}$
By (T-FACT3) rule, $\varnothing; \dot{\Phi}_e; \Delta; \dot{\Gamma}; B; \text{limit} \vdash \text{fact} : \text{Eq}(\tau_0, \tau_0)$
Then $\varnothing; \dot{\Phi}_e; \Delta; \dot{\Gamma}_e; B; \text{limit} \vdash e' : \text{Eq}(\tau_0, \tau_0)$
Thus, $\varnothing; \dot{\Phi}_e; \Delta; \dot{\Gamma}; B; \text{limit} \vdash e' : \tau$
Because $\Psi_{spare}, \Psi_e; \Phi_{spare}, \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash (M, e : \tau)$
And we don't change M, then $M' = M$
$\forall i \in dom(\Psi).(\varnothing; \dot{\Phi}'; \varnothing; \varnothing; true; \infty \vdash M'(i) : \Psi(i))$
Thus, $\Psi_{spare}, \Psi'_e; \Phi_{spare}, \Phi'_e; \Delta; \dot{\Gamma}; B; \text{limit} \vdash (M', e' : \tau)$

$\Psi'_e = \Psi_e;\ \Phi'_e = \Phi_e;\ M' = M$

19. $Case\, T - APPLYEQ$: $e = \text{apply\_eq}(\tau_f, e_1, e_2)$
$\Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash \text{apply\_eq}(\tau_f, e_1, e_2) : \tau$
By Lemma 6.2.1.(21), then $\tau_f \tau_b \equiv \tau$
and $\Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash \text{apply\_eq}(\tau_f, e_1, e_2) : \tau_f \tau_b$
$\Phi_e; \Delta \vdash \tau_f : K \to J \quad \Phi_e; \Delta \vdash \tau_a : K \quad \Phi_e; \Delta \vdash \tau_b : K$
$\Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash e_1 : \text{Eq}(\tau_a, \tau_b) \quad \Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash e_2 : \tau_f \tau_a$

$(E - APPLYEQ)$
$e_1 = \text{fact},\ e_2 = \text{v}$, and $e' = \text{v}$
By (T-FACT3) rule, $\varnothing; \dot{\Phi}_e; \Delta; \dot{\Gamma}; B; \text{limit} \vdash e_1 : \text{Eq}(\tau_{e_1}, \tau_{e_1})$,
then $\tau_{e_1} \equiv \tau_a \equiv \tau_b$, and $\varnothing; \dot{\Phi}_e; \Delta; \dot{\Gamma}; B; \text{limit} \vdash e : \tau_f \tau_b$,
Thus, $\varnothing; \dot{\Phi}_e; \Delta; \dot{\Gamma}; B; \text{limit} \vdash e_2 : \tau_f \tau_a \Rightarrow \varnothing; \dot{\Phi}_e; \Delta; \dot{\Gamma}_e; B; \text{limit} \vdash \text{v} : \tau_f \tau_b$
$\Rightarrow \varnothing; \dot{\Phi}_e; \Delta; \dot{\Gamma}; B; \text{limit} \vdash e' : \tau_f \tau_b$
Because $\Psi_{spare}, \Psi_e; \Phi_{spare}, \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash (M, e : \tau)$
And we don't change M, then $M' = M$
$\forall i \in dom(\Psi).(\varnothing; \dot{\Phi}'; \varnothing; \varnothing; true; \infty \vdash M'(i) : \Psi(i))$
By (T-MEM) rule, $\Psi_{spare}, \Psi'_e; \Phi_{spare}, \Phi'_e; \Delta; \Gamma; B; \text{limit} \vdash (M', e' : \tau)$
$\Psi'_e = \Psi_e;\ \Phi'_e = \Phi_e;\ M' = M$

20. $Case\, T - CASE$: $e = \text{case}(b, e_0)$
$\Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash \text{case}(b, e_0) : \tau$
By Lemma 6.2.1.(22), then $\tau \equiv \tau_i \quad (i = \begin{matrix} 1\, if\, b \\ 2\, if\, \neg b \end{matrix})$
and $\Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash e_0 : \text{Union}(b, \tau_1, \tau_2)$

$(E - CASE)$
$e_0 = \text{union}(\tau_b, \tau'_1, \tau'_2, v), \quad e' = v$
$\Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash \text{union}(\tau_b, \tau'_1, \tau'_2, v) : \text{Union}(b, \tau_1, \tau_2)$
By Lemma 6.2.1.(23), then $\tau_1 \equiv \tau'_1,\ \tau_2 \equiv \tau'_2,\ \ \tau_b \equiv b$ and
$\Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash \tau'_1 : K,\ \ \Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash \tau'_2 : K$
$\Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash v : \tau'_i \quad (i = \begin{matrix} 1\, if\, \tau_b \\ 2\, if\, \neg \tau_b \end{matrix})$
Thus, $\Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash e' : \tau'_i \quad (i = \begin{matrix} 1\, if\, b \\ 2\, if\, \neg b \end{matrix})$
By (T-EQ) rule, $\Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash e' : \tau$
Because $\Psi_{spare}, \Psi_e; \Phi_{spare}, \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash (M, e : \tau)$
And we don't change M, then $M' = M$
$\forall i \in dom(\Psi).(\varnothing; \dot{\Phi}'; \varnothing; \varnothing; true; \infty \vdash M'(i) : \Psi(i))$
By (T-MEM) rule, $\Psi_{spare}, \Psi'_e; \Phi_{spare}, \Phi'_e; \Delta; \Gamma; B; \text{limit} \vdash (M', e' : \tau)$
$\Psi'_e = \Psi_e;\ \Phi'_e = \Phi_e;\ M' = M$

21. $Case\, T - COERCE$: $e = \text{coerce}(e_0)$
$\Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit}_1 \vdash \text{coerce}(e_0) : \tau$
By Lemma 6.2.1.(24), then there is $\tau' \equiv \tau$
$\Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit}_1 \vdash \text{coerce}(e_0) : \tau'$
and $\Psi_e; \Phi_e; \Delta; \Gamma; B; I_2 \vdash e_0 : \tau'$

$(E - COERCE)$
$e_0 = v$, $e' = v$
Because $\Psi_e; \Phi_e; \Delta; \Gamma; B; I_2 \vdash e_0 : \tau'$, then $\Psi_e; \Phi_e; \Delta; \Gamma; B; I_2 \vdash v : \tau'$
By Limit-Change Lemma, $\Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit}_1 \vdash v : \tau'$
By (T-EQ) rule, $\Psi_e; \Phi_e; \Delta; \Gamma; B; \text{limit}_1 \vdash e' : \tau$
Because $\Psi_{spare}, \Psi_e; \Phi_{spare}, \Phi_e; \Delta; \Gamma; B; \text{limit} \vdash (M, e : \tau)$
And we don't change M, then $M' = M$
$\forall i \in dom(\Psi).(\varnothing; \dot{\Phi}'; \varnothing; \varnothing; true; \infty \vdash M'(i) : \Psi(i))$
By (T-MEM) rule, $\Psi_{spare}, \Psi'_e; \Phi_{spare}, \Phi'_e; \Delta; \Gamma; B; \text{limit} \vdash (M', e' : \tau)$
$\Psi'_e = \Psi_e;\ \Phi'_e = \Phi_e;\ M' = M$

22. All cases under the congruence evaluation lemma are similar.
We already proved some cases in (TUPLE), (LOAD), and (STORE).

6.3 Progress

Rephrase the type equivalence rules as parallel reduction rules:

$$(A) \qquad \Phi; B \vdash \tau \Rightarrow \tau$$

$$(B) \qquad \frac{\Phi; B \vdash \tau_a \Rightarrow \tau'_a \qquad \Phi; B \vdash \tau_b \Rightarrow \tau'_b}{\Phi; B \vdash (\lambda\alpha : K.\tau_b)\tau_a \Rightarrow [\alpha \mapsto \tau'_a]\tau'_b}$$

$$(C) \qquad \frac{B \vdash I \doteq i}{\Phi, \mathrm{F}^K \dot{\mapsto} \delta; B \vdash \mathrm{F}^K I \Rightarrow \delta(i)}$$

$$(D) \qquad \frac{B \vdash I_1 \doteq I_2}{\Phi; B \vdash I_1 \Rightarrow I_2}$$

$$(E) \qquad \frac{B \vdash B_1 \doteq B_2}{\Phi; B \vdash B_1 \Rightarrow B_2}$$

$$(F) \qquad \Phi; B \vdash \mathrm{Eq}(\tau_1, \tau_2) \Rightarrow \mathrm{Eq}(\tau_2, \tau_1)$$

$$(G) \qquad \frac{\forall i.(\Phi; B \vdash \tau_i \Rightarrow \tau'_i)}{\Phi; B \vdash T[\tau_1, \ldots, \tau_n] \Rightarrow T[\tau'_1, \ldots, \tau'_n]}$$

6.3.1 LEMMA [SINGLE-PARALLEL-STEP CONFLUENCE FOR TYPES]

If $C \vdash \tau_a \Rightarrow \tau_b$, and $C \vdash \tau_a \Rightarrow \tau_c$, then there is some τ_d so that $C \vdash \tau_b \Rightarrow \tau_d$ and $C \vdash \tau_c \Rightarrow \tau_d$.
Proof by induction on the sum of the sizes of the derivations of $\tau_a \Rightarrow \tau_b$ and $\tau_a \Rightarrow \tau_c$.

1. case $\tau_a \overset{A}{\Rightarrow} \tau_b$. Then $\tau_b = \tau_a$, so choose $\tau_d = \tau_c$.
2. case $\tau_a \overset{B}{\Rightarrow} \tau_b$ and $\tau_a \overset{B}{\Rightarrow} \tau_c$. The proof for this is standard.
3. case $\tau_a \overset{G}{\Rightarrow} \tau_b$ and $\tau_a \overset{B}{\Rightarrow} \tau_c$. The proof for this is standard.
4. case $\tau_a \overset{G}{\Rightarrow} \tau_b$ and $\tau_a \overset{G}{\Rightarrow} \tau_c$. The proof for this is standard.
5. case $\tau_a = \mathrm{Eq}(\tau_{a1}, \tau_{a2}) \overset{F}{\Rightarrow} \tau_b = \mathrm{Eq}(\tau_{a2}, \tau_{a1})$. If $\tau_a \overset{F}{\Rightarrow} \tau_c$, then choose $\tau_d = \tau_b = \tau_c$. If $\tau_a = \mathrm{Eq}(\tau_{a1}, \tau_{a2}) \overset{G}{\Rightarrow} \tau_c = \mathrm{Eq}(\tau_{c1}, \tau_{c2})$, then choose $\tau_d = \mathrm{Eq}(\tau_{c2}, \tau_{c1})$.

6. case $\tau_a = I_a \stackrel{D}{\Rightarrow} \tau_b = I_b$ and $\tau_a = I_a \stackrel{D}{\Rightarrow} \tau_c = I_c$. Then $I_a \doteq I_b \doteq I_c$, so pick $\tau_d = I_a$.

7. case $\tau_a = B_a \stackrel{E}{\Rightarrow} \tau_b = B_b$ and $\tau_a = B_a \stackrel{E}{\Rightarrow} \tau_c = B_c$. Then $B_a \doteq B_b \doteq B_c$, so pick $\tau_d = B_a$.

8. case $\tau_a = \mathrm{F}^K I_a \stackrel{C}{\Rightarrow} \tau_b = \delta(i_b)$. If $\tau_a \stackrel{C}{\Rightarrow} \tau_c = \delta(i_c)$, then $i_b = i_c$, so choose $\tau_d = \tau_b = \tau_c$. If $\tau_a = \mathrm{F}^K I_a \stackrel{G}{\Rightarrow} \tau_c = \mathrm{F}^K I_c$, then $i_b \doteq I_a \doteq I_c$, so choose $\tau_d = \tau_b$.

The other cases are either impossible, or are symmetric to one of the cases above.

6.3.2 LEMMA [CONFLUENCE FOR TYPES]

If $C \vdash \tau_a \stackrel{*}{\Rightarrow} \tau_b$, and $C \vdash \tau_a \stackrel{*}{\Rightarrow} \tau_c$, then there is some τ_d so that $C \vdash \tau_b \stackrel{*}{\Rightarrow} \tau_d$ and $C \vdash \tau_c \stackrel{*}{\Rightarrow} \tau_d$. Standard proof by tiling single parallel steps to fill in the area between $\tau_a \stackrel{*}{\Rightarrow} \tau_b$ and $\tau_a \stackrel{*}{\Rightarrow} \tau_c$.

6.3.3 CORROLARY [CONFLUENCE FOR EQUIVALENT TYPES]

If $C \vdash \tau_b \equiv \tau_c$, then there is some τ_d so that $C \vdash \tau_b \stackrel{*}{\Rightarrow} \tau_d$ and $C \vdash \tau_c \stackrel{*}{\Rightarrow} \tau_d$. Proof by induction on the derivation of $C \vdash \tau_b \equiv \tau_c$.

6.3.4 LEMMA [SHAPE PRESERVATION]

To prove progress, we must first say something about how values are typed. These are the values:

$$v = i \mid b \mid \Lambda\alpha : K; B.v \mid \mathrm{pack}[\tau_1, v] \,\mathrm{as}\, \exists\alpha : K; B.\tau_2$$

$$\mid \mathrm{roll}[(\mu\alpha : K.\tau_0)\tau_1 \cdots \tau_n](v) \mid \lambda x : \tau \stackrel{\phi,\mathrm{limit}}{\longrightarrow} e \mid \phi\langle \overrightarrow{v} \rangle \mid \mathrm{union}(b, \tau_1, \tau_2, v) \mid \mathrm{fact}$$

For these values, there are type checking rules that give the values the following types:

$$\tau = \tau_1 \stackrel{\phi,limit}{\longrightarrow} \tau_2 \mid \langle \overrightarrow{\tau} \rangle \mid \forall\alpha : K; B.\tau$$

$$\mid \exists\alpha : K; B.\tau \mid (\mu\alpha : K.\tau)\tau_1 \cdots \tau_n \mid \mathrm{Int}(I) \mid \mathrm{Bool}(B) \mid \mathrm{Union}(B, \tau_1, \tau_2)$$

$$\mid \mathrm{Has}(I, \tau) \mid \mathrm{Gen}(\tau, I) \mid \mathrm{Eq}(\tau_1, \tau_2) \mid \mathrm{InDomain}(I, \tau)$$

In addition, there is the (T-EQ) rule, which can also give a value a type. Call the 12 different categories of types listed above the 12 *value shapes*. If $\tau \Rightarrow \tau'$, and τ has a value shape, then τ' has the same value shape (proof by case analysis on $\tau \Rightarrow \tau'$). Combining this with confluence, we conclude that if $C \vdash \tau_b \equiv \tau_c$, and τ_b and τ_c have value shapes, there is some τ_d so that $C \vdash \tau_b \stackrel{*}{\Rightarrow} \tau_d$ and $C \vdash \tau_c \stackrel{*}{\Rightarrow} \tau_d$, and τ_d has the same shape as τ_b and τ_c, which implies that τ_b and τ_c have the same shape.

6.3.5 LEMMA [CANONICAL FORMS]

Suppose v is a closed, well-typed expression: $C \vdash v : \tau$ for some τ, $C = \Psi; \Phi; \varnothing; \varnothing; B; \mathrm{limit}$.

1. If $C \vdash v : \tau_1 \stackrel{\phi,limit}{\longrightarrow} \tau_2$, then $v = \lambda x : \tau_1 \stackrel{\phi,limit}{\longrightarrow} e$.

2. If $C \vdash v : \langle \tau_1, \ldots \tau_n \rangle$, then $v = \langle v_1, \ldots, v_n \rangle$.

3. If $C \vdash v : \forall\alpha : K; B.\tau$, then $v = \Lambda\alpha : K; B.v_0$.

4. If $C \vdash v : \exists\alpha : K; B.\tau_2$, then $v = \mathrm{pack}[\tau_1, v_0] \,\mathrm{as}\, \exists\alpha : K; B.\tau_2$.

5. If $C \vdash v : (\mu\alpha : K.\tau_0)\tau_1 \cdots \tau_n$, then $v = \mathrm{roll}[(\mu\alpha : K.\tau_0)\tau_1 \cdots \tau_n](v_0)$.

6. If $C \vdash v : \mathrm{Int}(I)$, then $v = i$.

7. If $C \vdash v : \text{Bool}(B)$, then $v = b$.

8. If $C \vdash v : \text{Union}(b, \tau_1, \tau_2)$, then $v = \text{union}(b, \tau_1, \tau_2, v_0)$.

9. If $C \vdash v : \text{Has}(I, \tau)$ or $C \vdash v : \text{Gen}(\tau, I)$ or $C \vdash v : \text{Eq}(\tau_1, \tau_2)$ or $C \vdash v : \text{InDomain}(I, \tau)$, then $v = \text{fact}$.

Proof:

1. Only two type checking rules can prove $C \vdash v : \tau_1 \stackrel{\phi,limit}{\longrightarrow} \tau_2$: (T-EQ) and (T-ABS).
   For (T-EQ) rule, there is some $\tau' \equiv \tau_1 \stackrel{\phi,limit}{\longrightarrow} \tau_2$. By shape preservation, $\tau' = \tau_1' \stackrel{\phi,limit}{\longrightarrow} \tau_2'$. Use induction.
   By (T-ABS) rule, we know $v = \lambda x : \tau_1 \stackrel{\phi,limit}{\longrightarrow} e$ is an abstraction.

2. The similar proof for the other cases.

6.3.6 THEOREM[PROGRESS]

If (M, e) is closed and well-typed ($C_{Me} \vdash (M, e : \tau)$ for some τ and $C_{Me} = \Psi_{Me}; \Phi_{Me}; \varnothing; \varnothing; B; \text{limit}$), then either e is a value or else there is some (M', e') so that $(M, e) \to (M', e')$.

Observe that by the rule for typing (M, e), we know that $\Psi_{Me} = \Psi_{spare}, \Psi$ and $\Phi_{Me} = \Phi_{spare}, \Phi$ and $C \vdash e : \tau$, where $C = \Psi; \Phi; \varnothing; \varnothing; B; \text{limit}$. Now prove that (M, e) steps, by induction on the derivation of $C \vdash e : \tau$ (holding M, Ψ_{Me}, and Φ_{Me} fixed throughout the induction as C, e, and τ vary).

Proof :

First, if $e = E[e_0]$ where e_0 is not a value, then by inspection of the type checking rules, $C_0 \vdash e_0 : \tau_0$, where $C_0 = \Psi_0; \Phi_0; \varnothing; \varnothing; B; \text{limit}_0$ and $\Psi_{Me} = \Psi_{0-spare}, \Psi_0$ $\Phi_{Me} = \Phi_{0-spare}, \Phi_0$, so by induction, $(M, e_0) \to (M', e_0')$, so $(M, e) = (M, E[e_0]) \to (M', E[e_0'])$. Second, the (T-EQ) case is an easy induction. For all other cases where e is not a value:

1. $e = x$
   It will not happen, because e is closed.

2. $e = v_1\, v_2$, where $(T-APP)\dfrac{\begin{array}{c} C_1, C_2 = \Psi; \Phi; \Delta; \Gamma; B; \text{limit}_C \\ C_1 \vdash v_1 : \tau_a \stackrel{\phi,\text{limit}_f}{\longrightarrow} \tau_b \quad C_2 \vdash v_2 : \tau_a \\ (\text{limit}_C = \text{limit}_f = \infty) \text{ or } (B \vdash \text{limit}_f < \text{limit}_C) \\ \text{or } (\text{limit}_C = \infty,\ \text{limit}_f = I,\ \Phi; \Delta \vdash \tau_b : \overset{\phi_b}{0}) \end{array}}{C_1, C_2 \vdash v_1\, v_2 : \tau_b}$.
   By canonical forms, $v_1 = \lambda x : \tau_a \stackrel{\phi,limit_f}{\longrightarrow} e_0$, so e steps by (E-APPABS).

3. $e = v_1 \tau_2$, where $(T-TAPP)\dfrac{\begin{array}{c} C \vdash v_1 : \forall \alpha : K; B.\tau_1 \\ C \vdash \tau_2 : K \\ C \vdash [\alpha \mapsto \tau_2]B \end{array}}{C \vdash v_1 \tau_2 : [\alpha \mapsto \tau_2]\tau_1}$.
   By canonical forms, $v_1 = \Lambda \alpha : K; B.v$, so e steps by (E-TAPPABS).

4. $e = \text{unpack}\, \alpha, x = v_1 \,\text{in}\, e_2$, where $(T-UNPACK)\dfrac{\begin{array}{c} C_1 \vdash v_1 : \exists \alpha : K; B.\tau_1 \\ C_2, \alpha : K, x : \tau_1, B \vdash e_2 : \tau_2 \end{array}}{C_1, C_2 \vdash \text{unpack}\, \alpha, x = v_1 \,\text{in}\, e_2 : \tau_2}$.
   By canonical forms, $v_1 = \text{pack}[\tau_1, v]\, \text{as}\, \exists \alpha : K; B.\tau_2$, so e steps by (E-UNPACK).

5. $e = \text{in\_domain}(I_1, I_2, v_1, v_2)$, where $(T{-}INDOMAIN)\dfrac{\begin{array}{c} C_1, C_2 \vdash I_1 : \text{int} \quad C_1, C_2 \vdash I_2 : \text{int} \\ C_1 \vdash v_1 : \text{InDomain}(I_1, \tau_f) \quad C_2 \vdash v_2 : \text{Gen}(\tau_f, I_2) \end{array}}{C_1, C_2 \vdash \text{in\_domain}(I_1, I_2, v_1, v_2) : \wedge \langle \text{Know}(0 \le I_1 \wedge I_1 < I_2), \text{Gen}(\tau_f, I_2) \rangle}$.
   By canonical forms, $v_1 = \text{fact}$ and $v_2 = \text{fact}$, so e steps by (E-DOMAIN).

6. The pattern in the previous cases is pretty clear: the type checking rule implies that any subexpression values have a canonical form, which then allows e to step. The cases for $e_1\, \text{op}\, e_2$, $\neg e$, $\text{case}(b, e)$, $\text{unroll}(e)$, $\text{apply\_eq}(\tau, e_1, e_2)$, $\text{discard\_fun}(e)$, $\text{define\_fun}(e, \tau)$, $\text{distinguish}(I_1, I_2, e_1, e_2)$, and $\text{in\_domain}(I_1, I_2, e_1, e_2)$ follow exactly the same pattern.

7. $e = \text{new\_fun}(K)$, $e = \text{make\_eq}(\tau)$, $e = \text{coerce}(v)$, $e = \text{fix}\, x : \tau.\text{v}$: these always step, so we don't even need to look at the type checking rules.

8. $e = \text{let}\, \langle x_1, \ldots, x_n \rangle = v_a \,\text{in}\, e_b$, where $(T - LET)\frac{C_a \vdash v_a : \langle \overrightarrow{\tau} \rangle \quad C_b, \overrightarrow{x:\tau} \vdash e_b : \tau_b}{C_a, C_b \vdash \text{let}\, \langle \overrightarrow{x} \rangle = v_a \,\text{in}\, e_b : \tau_b}$.
   By canonical forms, $v_a = \phi\langle v_1, \ldots, v_n \rangle$, so e steps by (E-LET).

9. $e = \text{if}\, v_1 \,\text{then}\, e_2 \,\text{else}\, e_3$, where $(T - IFE)\frac{C_a \vdash v_1 : \text{Bool}(B) \quad C_b, B \vdash e_2 : \tau \quad C_b, \neg B \vdash e_3 : \tau}{C_a, C_b \vdash \text{if}\, v_1 \,\text{then}\, e_2 \,\text{else}\, e_3 : \tau}$.
   By canonical forms, $v_1 = b$, so e steps by (E-IF1) or (E-IF2).

10. $e = \text{if}\, B \,\text{then}\, e_1 \,\text{else}\, e_2$, where $(T - IFB)\frac{\begin{array}{c} C = \Psi; \Phi; \Delta; \Gamma; B_C; I \\ C \vdash B : \text{bool} \quad C, B \vdash e_1 : \tau \quad C, \neg B \vdash e_2 : \tau \end{array}}{C \vdash \text{if}\, B \,\text{then}\, e_1 \,\text{else}\, e_2 : \tau}$.
    Since no type variables are in scope, B cannot contain any type variables, which means that $C \vdash B \doteq b$ for some b, so e steps by (E-IFB1) or (E-IFB2).

11. $e = \text{load}(v_{\text{ptr}}, v_{\text{Has}})$, where $(T - LOAD)\frac{C_1 \vdash v_{\text{ptr}} : \text{Int}(I) \quad C_2 \vdash v_{\text{Has}} : \text{Has}(I, \tau)}{C_1, C_2 \vdash \text{load}(v_{\text{ptr}}, v_{\text{Has}}) : \wedge\langle \tau, \text{Has}(I, \tau) \rangle}$.
    By canonical forms, $v_{ptr} = i_{ptr}$, and $v_{Has} = \text{fact}$. By inversion, $C_1 \vdash i_{ptr} : Int(i_{ptr})$ and $C_2 = C_2', i_{has} \mapsto \tau \vdash \text{fact} : \text{Has}(i_{has}, \tau)$. Together, these imply $i_{ptr} = i_{has}$. Since $i_{has} \mapsto \tau \in \Psi$ and memory M is well-typed under $C_{Me} = \Psi_{Me}; ...$, where $\Psi_{Me} = \Psi_{spare}, \Psi$, we know $i_{has} \mapsto \tau \in \Psi_{Me}$, so $M(i_{has})$ exists, so $M(i_{ptr})$ exists, so e steps by (E-LOAD).

12. $e = \text{store}(v_{\text{ptr}}, v_{\text{Has}}, v_{\text{v}})$, where $(T - STORE)\frac{\begin{array}{c} C = C_1, C_2, C_3 = \Psi; \Phi; \Delta; \Gamma; B; \infty \\ C_2 \vdash v_{\text{Has}} : \text{Has}(I, \tau_1) \quad C_3 \vdash v_{\text{v}} : \tau_2 \\ C_1 \vdash v_{\text{ptr}} : \text{Int}(I) \quad C \vdash \tau_2 :\dot{1} \end{array}}{C \vdash \text{store}(v_{\text{ptr}}, v_{\text{Has}}, v_{\text{v}}) : \text{Has}(I, \tau_2)}$.
    By canonical forms, $v_{ptr} = i_{ptr}$, and $v_{Has} = \text{fact}$, so e steps by (E-STORE).

7 Strong Normalization

This section proves that well-typed terms in a limited environment eventually step to a value: if $\Psi_{Me}; \Phi_{Me}; \varnothing; \varnothing; \text{true}; i \vdash (M, e : \tau)$, then there is some v so that $(M, e) \xrightarrow{*} (M, v)$.

The proof is by induction on the limit i, the maximum nesting depth of let and unpack expressions, and the size of e. Define the depth as follows:

$\text{depth}(x) = 0$

$\text{depth}(\lambda x : \tau \xrightarrow{\phi} e) = 0$

$\text{depth}(\text{fix}\, x.v) = 0$

$\text{depth}(\text{let}\, x_1, \cdots, x_n = e_1 \,\text{in}\, e_2) = \max(\text{depth}(e_1), 1 + \text{depth}(e_2))$

$\text{depth}(\text{unpack}\, \alpha, x = e_1 \,\text{in}\, e_2) = \max(\text{depth}(e_1), 1 + \text{depth}(e_2))$

For all other expressions, the depth is the maximum depth of any of the immediate subexpressions: $\text{depth}(e_1\, e_2) = \max(\text{depth}(e_1), \text{depth}(e_2))$, $\text{depth}(\text{pack}[\tau_1, e] \,\text{as}\, \exists \alpha : K; B.\tau_2) = \text{depth}(e)$, and so on.

Define $\text{size}(v)$ to be 1. For a non-value expression e, define $\text{size}(e)$ to be 1 plus the size of each of e's subexpressions.

Lemma 0: $\text{depth}(v) = 0$. Proof by induction on the structure of v. The only value that has a non-value expression inside it is $\lambda x : \tau \xrightarrow{\phi} e$, which has depth 0 by definition.

Lemma 1: $\text{depth}([x \mapsto v]e) \leq \text{depth}(e)$. Easy proof by induction on the structure of e.

Lemma 2: $[x \mapsto e]v$ is a value. Easy proof by induction on the structure of v.

7.1 LEMMA [SINGLE-STEP SIZE REDUCTION]

If $\Psi_{Me}; \Phi_{Me}; \varnothing; \varnothing; \text{true}; i \vdash (M, e : \tau)$ and $\Psi; \Phi; \varnothing; \varnothing; \text{true}; i \vdash e : \tau$ and $(M, e) \rightarrow (M', e')$ by a non-congruence rule, then $M = M'$ and one of these three must be true:

1. $e' = \text{coerce}(e'')$ and $i' < i$, $\Psi'; \Phi'; \varnothing; \varnothing; \text{true}; i' \vdash e'' : \tau$
2. $\Psi'; \Phi'; \varnothing; \varnothing; \text{true}; i \vdash e' : \tau$, and $\text{depth}(e') < \text{depth}(e)$

3. $\Psi'; \Phi'; \varnothing; \varnothing; \text{true}; i \vdash e' : \tau$, and $\text{depth}(e') = \text{depth}(e)$, and $\text{size}(e') < \text{size}(e)$

Proof :

By cases on the derivation that $(M, e) \to (M, e')$.

1. $e = (\lambda x : \tau \xrightarrow{\phi, I} e_1)v_2$
and $e' = \text{coerce}([x \mapsto v_2]e_1)$, and $e'' = [x \mapsto v_2]e_1$
By Lemma 6.2.1.(2) and (T-EQ) rule, we know
$\Psi; \Phi; \varnothing; \varnothing; \text{true}; i \vdash (\lambda x : \tau \xrightarrow{\phi, I} e_1)v_2 : \tau_b$,
$\Psi_1; \Phi_1; \varnothing; \varnothing; \text{true}; i_f \vdash e_1 : \tau_a \xrightarrow{f} \tau_b$, and $(i > i_f)$
$\Psi_2; \Phi_2; \varnothing; \varnothing; \text{true}; i \vdash v_2 : \tau_a$
By Limit-Change Lemma, $\Psi_2; \Phi_2; \varnothing; \varnothing; \text{true}; i_f \vdash v_2 : \tau_a$
By Term Substitution Lemma, we obtain:
$\Psi; \Phi; \varnothing; \varnothing; \text{true}; i_f \vdash [x \mapsto v_2]e_1 : \tau_b$
$\Psi; \Phi; \varnothing; \varnothing; \text{true}; i_f \vdash e'' : \tau_b$
Now case 1 of the lemma will be true.

2. $e = (\lambda x : \tau \xrightarrow{\phi, \infty} e_1)v_2$ won't type-check, because if $\text{limit}_f = \infty$, then $\text{limit}_C = \infty$.

3. $e = \text{let}\, x_1, \cdots, x_n = e_1 \,\text{in}\, e_2 \quad (e_1 = \phi\langle v_1, \cdots, v_n\rangle)$
$e' = [x_1 \mapsto v_1, \cdots, x_n \mapsto v_n]e_2$
In Preservation Lemma we have proved, $\Psi; \Phi; \varnothing; \varnothing; \text{true}; i \vdash e' : \tau$
From lemma 1, we know $\text{depth}([x_1 \mapsto v_1, \cdots, x_n \mapsto v_n]e_2) \leq e_2$
And $\text{depth}(\text{let}\, x_1, \cdots, x_n = e_1 \,\text{in}\, e_2) = \max(\text{depth}(e_1), 1 + \text{depth}(e_2))$,
so $\text{depth}(e') < \text{depth}(\text{let}\, x_1, \cdots, x_n = e_1 \,\text{in}\, e_2)$
Now case 2 of the lemma will be true.

4. $e = \text{unpack}\, \alpha, x = e_1 \,\text{in}\, e_2$
$e' = [\alpha \mapsto \tau_0, x \mapsto v]e_2$
In Preservation Lemma we have proved, $\Psi; \Phi; \varnothing; \varnothing; \text{true}; i \vdash e' : \tau$
From lemma 1, we know $\text{depth}([\alpha \mapsto \tau_0, x \mapsto v]e_2) \leq e_2$
And $\text{depth}(\text{unpack}\, \alpha, x = e_1 \,\text{in}\, e_2) = \max(\text{depth}(e_1), 1 + \text{depth}(e_2))$,
so $\text{depth}(e') < \text{depth}(\text{unpack}\, \alpha, x = e_1 \,\text{in}\, e_2)$
Now case 2 of the lemma will be true.

5. All other cases. In Preservation Lemma we have proved, $\Psi; \Phi; \varnothing; \varnothing; \text{true}; i \vdash e' : \tau$.
$\text{size}(\text{load}(i, \text{fact})) = 1 + \text{size}(i) + \text{size}(\text{fact}) > \text{size}(\hat{}\langle M(i), \text{fact}\rangle) = 1$, because $M(i)$ is a value, so $\hat{}\langle M(i), \text{fact}\rangle$ is a value, and the size of a value is defined to be 1.
$\text{size}(\text{coerce}(v)) = 1 + \text{size}(v) > \text{size}(v) = 1$
$\text{size}((\Lambda\alpha : K; B.v)\tau) = 1 + \text{size}(v) > \text{size}(v) = 1$
$\text{size}(\text{if}\, v_1 \,\text{then}\, e_2 \,\text{else}\, e_3) = 1 + \text{size}(v_1) + \text{size}(e_2) + \text{size}(e_3) > \text{size}(e_2) \,\text{or}\, \text{size}(e_2)$
$\text{size}(\text{if}\, B \,\text{then}\, e_2 \,\text{else}\, e_3) = 1 + \text{size}(e_2) + \text{size}(e_3) > \text{size}(e_2) \,\text{or}\, \text{size}(e_2)$
$\text{size}(\text{unroll}(\text{roll}[\tau](v))) = 1 + 1 + \text{size}(v) > \text{size}(v)$
$\text{size}(\text{fix}\, x : \tau.v) = 1 + \text{size}(v) > \text{size}([x \mapsto \text{fix}\, x : \tau.v]v) = 1 \quad$ (By Lemma 2)
$\text{size}(\text{case}(b, \text{union}(b, \tau_1, \tau_2, v))) = 1 + 1 + \text{size}(b) + \text{size}(v) + \text{size}(b) > \text{size}(v) = 1$
$\text{size}(\text{in\_domain}(I_1, I_2, \text{fact}, \text{fact})) = 1 + \text{size}(I_1) + \text{size}(I_2) + \text{size}(\text{fact}) + \text{size}(\text{fact}) > \text{size}(e') = 1$
$\text{size}(\text{distinguish}(I_1, I_2, \text{fact}, \text{fact})) = \text{size}(I_1) + \text{size}(I_2) + \text{size}(\text{fact}) + \text{size}(\text{fact}) > \text{size}(e') = 1$
$\text{size}(\text{make\_eq}(\tau)) > \text{size}(\text{fact}) = 1$
$\text{size}(\text{apply\_eq}(\tau, \text{fact}, v)) > \text{size}(v) = 1$
$\text{size}(\text{new\_fun}(K)) > \text{size}(e') = 1$
$\text{size}(\text{discard\_fun}(\text{fact})) > \text{size}(\cdot\langle\rangle) = 1$
$\text{size}(\text{define\_fun}(\text{fact}, \tau)) > \text{size}(\hat{}\langle \text{fact}, \text{fact}, \text{fact}\rangle) = 1$
Notice that e cannot be a store expression, because store expressions do not type-check in an environment with limit

i. In the absence of the store and congruence evaluation rules, no evaluation rule alters memory, so $M' = M$.

7.2 THEOREM [STRONG NORMALIZATION]

If $\Psi_{Me}; \Phi_{Me}; \varnothing; \varnothing; \text{true}; i \vdash (M, e : \tau)$, then e must step to a value in a finite sequence of zero or more steps, without changing memory: $(M, e) \to (M, e_1) \to \cdots \to (M, e_n) \to (M, v)$. (Notation: $(M, e) \xrightarrow{*} (M, v)$).

Observe that by the rule for typing (M, e), we know that $\Psi_{Me} = \Psi_{spare}, \Psi$ and $\Phi_{Me} = \Phi_{spare}, \Phi$ and $C \vdash e : \tau$, where $C = \Psi; \Phi; \varnothing; \varnothing; B; \text{limit}$.

Proof :

By induction on the limit i. We assume theorem is true for all $i' < i$

For $i' = i$ by induction on depth(e). We assume theorem is true for all $i' = i$, and depth(e') < depth(e)

For $i' = i$, and depth(e') = depth(e) by induction on size(e). We assume theorem is true for all $i' = i$, depth(e') = depth(e), and size(e') < size(e).

If e is a already a value v, then in zero steps, (M, e) steps to (M, v). Otherwise, we'll show that (M, e) steps to (M, v) in two stages: first, use any applicable congruence rules if $e = E[e_0]$ for some E and e_0. After congruence is exhausted, use the single-step size reduction lemma.

The congruence stage is the same pattern for all expressions, so we arbitrarily pick $e = \text{load}(e_1, e_2)$ to illustrate the pattern; the proof is the same for other expressions. Suppose $e_1$is not a value. By the rule for typing (M, e), we know that $\Psi_{Me} = \Psi_{spare}, \Psi$ and $\Phi_{Me} = \Phi_{spare}, \Phi$ and $C \vdash e : \tau$, where $C = \Psi; \Phi; \varnothing; \varnothing; B; i$, and by inspection of the type checking rules, we conclude that there is some $C_1 = \Psi_1; \Phi_1; \varnothing; \varnothing; B; i_1$, where $i_1 \leq i$, so that $C_1 \vdash e_1 : \tau_1$ (for $e = \text{load}(e_1, e_2)$, we actually know $i_1 = i$, but more generally, we can only say $i_1 \leq i$, since $e = \text{coerce}(e_1)$ requires $i_1 < i$). Since e_1 is a subexpression inside e, it is easy to show that depth$(e_1) \leq$ depth(e), and size(e_1) < size(e). Therefore, either $i_1 < i$, or $i_1 = i$ and depth(e_1) < depth(e), or $i_1 = i$ and depth(e_1) = depth(e) and size(e_1) < size(e), so induction tells us that $(M, e_1) \xrightarrow{*} (M, v_1)$. By repeated application of the congruence rule, $(M, \text{load}(e_1, e_2)) \xrightarrow{*} (M, \text{load}(v_1, e_2))$. We can repeat this argument for e_2 to show that $(M, \text{load}(v_1, e_2)) \xrightarrow{*} (M, \text{load}(v_1, v_2))$. Thus, we step to an expression $e_c = \text{load}(v_1, v_2)$ where no congruence rules apply. If this expression is a value (not possible for load(v_1, v_2), but possible in other cases, such as tuples), then we've proved that (M, e) steps to some (M, v). Otherwise, type preservation tells us that (M, e_c) is well-typed with the same limit i: $\Psi'_{Me}; \Phi'_{Me}; \varnothing; \varnothing; \text{true}; i \vdash (M, e_c : \tau)$.

Once we've stepped $(M, e) \xrightarrow{*} (M, e_c)$, where e_c is not a value and no congruence rules apply to e_c, type progress tells us that $(M, e_c) \to (M', e')$ for some (M', e'). Then the single-step size reduction lemma says that $(M, e_c) \to (M, e')$, where one of three cases must be true:

1. $e' = \text{coerce}(e'')$ and $i' < i$, $\Psi'; \Phi'; \varnothing; \varnothing; \text{true}; i' \vdash e'' : \tau$
2. $\Psi'; \Phi'; \varnothing; \varnothing; \text{true}; i \vdash e' : \tau$, and depth$(e')$ < depth(e_c)
3. $\Psi'; \Phi'; \varnothing; \varnothing; \text{true}; i \vdash e' : \tau$, and depth$(e')$ = depth(e_c), and size(e') < size(e_c)

In each case, we prove that $(M, e_c) \xrightarrow{*} (M, v)$:

1. $e' = \text{coerce}(e'')$ and $i' < i$, $\Psi'; \Phi'; \varnothing; \varnothing; \text{true}; i' \vdash e'' : \tau$. In this case, e'' type-checks in an environment with a smaller limit $i' < i$. By induction on i, we know $(M, e'') \xrightarrow{*} (M, v)$. By repeated applications of the congruence rule for coerce(e''), we conclude that $(M, \text{coerce}(e'')) \xrightarrow{*} (M, \text{coerce}(v))$. E-COERCE then says that $(M, \text{coerce}(v)) \to (M, v)$. Putting the $(M, e_c) \to (M, e')$ and $(M, \text{coerce}(e'')) \xrightarrow{*} (M, \text{coerce}(v))$ and $(M, \text{coerce}(v)) \to (M, v)$ steps together, we conclude $(M, e_c) \xrightarrow{*} (M, v)$.

2. $\Psi'; \Phi'; \varnothing; \varnothing; \text{true}; i \vdash e' : \tau$, and depth$(e')$ < depth(e_c). By induction on depth(e), we know $(M, e') \xrightarrow{*} (M, v)$. Putting this together with $(M, e_c) \to (M, e')$, we conclude $(M, e_c) \xrightarrow{*} (M, v)$.

3. $\Psi'; \Phi'; \varnothing; \varnothing; \text{true}; i \vdash e' : \tau$, and depth$(e')$ = depth(e_c), and size(e') < size(e_c). By induction on size(e), we know $(M, e') \xrightarrow{*} (M, v)$. Putting this together with $(M, e_c) \to (M, e')$, we conclude $(M, e_c) \xrightarrow{*} (M, v)$.

All three cases prove $(M, e_c) \xrightarrow{*} (M, v)$. This, together with $(M, e) \xrightarrow{*} (M, e_c)$, shows $(M, e) \xrightarrow{*} (M, v)$.

8 Progress after Type Erasure

This section proves that progress holds after type erasure.

If e is a closed, well-typed expression ($C \vdash e : \tau$ for some τ and $C = \Psi; \Phi; \emptyset; \emptyset; B; \text{limit}$), then the following statements hold:

1. (Erasure-Progress-1) If $(M, e) \mapsto (M', e')$ then $\text{erase}((M, e)) \stackrel{?}{\mapsto} \text{erase}((M', e'))$.
2. (Erasure-Progress-2) If $\text{erase}(e)$ is a value then $(M, e) \stackrel{*}{\mapsto} (M', v)$, $\text{erase}((M, e)) = \text{erase}((M', v))$.
3. (Erasure-Progress-3) If $\text{erase}((M, e)) \mapsto (L', d')$ then $(M, e) \stackrel{+}{\mapsto} (M', e')$, $\text{erase}((M', e')) = (L', d')$.

In the cases where e does not effect memory ($M = M'$), $(M, e) \mapsto (M', e')$ is abreviated to $e \mapsto e'$. The cases involving loads, stores, and congruence rules have the potential to affect memory and cannot be shortened.

8.1 Lemmas

8.1.1 LEMMA [ERASE-SIMPLIFY]

If $\text{simplify}(e)$ exists, then $\text{erase}(\text{simplify}(e)) = \text{simplify}(\text{erase}(e))$. Proof by cases of e for which $\text{simplify}(e)$ is defined (in all such cases, $e = \text{erase}(e)$).

8.1.2 LEMMA [ERASE-TERM-SUBSTITUTION]

$\text{erase}([x \mapsto v]e) = [x \mapsto \text{erase}(v)]\,\text{erase}(e)$. Proof by induction on the expression e.

8.1.3 LEMMA [ERASE-TYPE-SUBSTITUTION]

$\text{erase}([\alpha \mapsto \tau]e) = \text{erase}(e)$. Proof by induction on the expression e.

8.1.4 LEMMA [VALUE-ERASE-VALUE]

A value will always erase to a value. Proof by induction on the values.

1. $\text{erase}(i) = i$ by (ER-i).
2. $\text{erase}(b) = b$ by (ER-b).
3. $\text{erase}(\Lambda\alpha : K; B.v) = \text{erase}(v)$by (ER-TFUN). Another value erase rule will subsequently apply.
4. $\text{erase}(\text{pack}[\tau_1, v]\,\text{as}\,\exists\alpha : K; B.\tau_2) = \text{erase}(v)$by (ER-PACK). Another value erase rule will subsequently apply.
5. $\text{erase}(\text{roll}[(\mu\alpha : K.\tau_0)\tau_1 \cdots \tau_n](v)) = \text{erase}(v)$ by (ER-ROLL). Another value erase rule will subsequently apply.
6. $\text{erase}(\lambda x : \tau \stackrel{\phi,I}{\longrightarrow} e) = \langle\rangle$ by (ER-FUNI).
7. $\text{erase}(\lambda x : \tau \stackrel{\phi,\infty}{\longrightarrow} e) = \lambda x \longrightarrow \text{erase}(e)$ by (ER-FUN). Another erase rule will apply but this is already a value.
8. $\text{erase}(\phi\langle\overrightarrow{v}\rangle) = \langle\,\text{erase}(v_1), \text{erase}(v_2), \ldots, \text{erase}(v_n)\rangle$ by (ER-TUPLE). Other value erase rules will subsequently apply.
9. $\text{erase}(\text{union}(b, \tau_1, \tau_2, v)) = \text{erase}(v)$ by (ER-UNION). Another value erase rule will subsequently apply.
10. $\text{erase}(\text{fact}) = \langle\rangle$ by (ER-FACT).

All the value erase rules produce either values or the erase of another value.

8.1.5 LEMMA [ZERO-ERASE-VALUE]

If $C \vdash v : \tau$ then $\text{erase}(v : t :\overset{\phi}{0}) = \langle\rangle$. A value with Kind $\overset{\phi}{0}$ will erase to $\langle\rangle$. Proof by induction on the values.

- Case: i. By Inversion and (T-INT), $i : \text{Int}(i)$. By (K-INT), $i : \text{Int}(i) :\dot{1}$. This does not have Kind $\overset{\phi}{0}$.
- Case: b. By Inversion and (T-BOOL), $b : \text{Bool}(b)$. By (K-BOOL), $b : \text{Bool}(b) :\dot{1}$. This does not have Kind $\overset{\phi}{0}$.
- Case: $\Lambda\alpha : K; B.v$. By (ER-TFUN) $\text{erase}(\Lambda\alpha : K; B.v) = \text{erase}(v)$. By (T-TABS), $v : \tau$ and $(\Lambda\alpha : K; B.v) : \forall\alpha : K; B.\tau$. By induction, if $v : t :\overset{\phi}{0}$, $\text{erase}(v) = \langle\rangle$. By (K-ALL), $(\forall\alpha : K; B.\tau) : K_2$ and $\tau : K_2$. Therefore $(\Lambda\alpha : K; B.v) : (\forall\alpha : K; B.\tau) : K_2$ and $v : \tau : K_2$. If $K_2 =\overset{\phi}{0}$, $\text{erase}((\Lambda\alpha : K; B.v) : (\forall\alpha : K; B.\tau) :\overset{\phi}{0}) = \text{erase}(v : \tau :\overset{\phi}{0}) = \langle\rangle$.
- Case: $\text{pack}[\tau_1, v]\,\text{as}\,\exists\alpha : K; B.\tau_2$. By Inversion and (T-PACK), $\text{pack}[\tau_1, v]\,\text{as}\,\exists\alpha : K; B.\tau_2 : K; B.\tau_2$ and $\tau_1 : K$ and $v : [\alpha \mapsto \tau_1]\tau_2$. By (ER-PACK), $\text{erase}(\text{pack}[\tau_1 : K, v]\,\text{as}\,\exists\alpha : K; B.\tau_2 : K; B.\tau_2) = \text{erase}(v : \tau_1 : K)$. By induction, if $v : t :\overset{\phi}{0}$, $\text{erase}(v) = \langle\rangle$. If $K =\overset{\phi}{0}$, $\text{erase}(\text{pack}[\tau_1 :\overset{\phi}{0}, v]\,\text{as}\,\exists\alpha :\overset{\phi}{0}; B.\tau_2 :\overset{\phi}{0}; B.\tau_2) = \text{erase}(v : \tau_1 :\overset{\phi}{0}) = \langle\rangle$.
- Case: $\text{roll}[(\mu\alpha : K.\tau_0)\tau_1 \cdots \tau_n](v)$. By Inversion and (T-ROLL), $\text{roll}[(\mu\alpha : K.\tau_0)\tau_1 \cdots \tau_n](v) : ((\mu\alpha : K.\tau_0)\tau_1 \ldots \tau_n)$ and $v : ([\alpha \mapsto \mu\alpha : K.\tau_0]\tau_0)\tau_1 \ldots \tau_n$ and $\tau_0 : K$. By (K_REC), $(\mu\alpha : K.\tau_0) : K$. Therefore, $v : ([\alpha \mapsto \mu\alpha : K.\tau_0]\tau_0)\tau_1 \ldots \tau_n : K$ and $\text{roll}[(\mu\alpha : K.\tau_0)\tau_1 \cdots \tau_n](v) : ((\mu\alpha : K.\tau_0)\tau_1 \ldots \tau_n) : K$. By (ER-ROLL), $\text{erase}(\text{roll}[(\mu\alpha : K.\tau_0)\tau_1 \cdots \tau_n](v)) = \text{erase}(v)$. By induction, if $v : t :\overset{\phi}{0}$, $\text{erase}(v) = \langle\rangle$. If $K =\overset{\phi}{0}$, $\text{erase}(\text{roll}[(\mu\alpha :\overset{\phi}{0} .\tau_0)\tau_1 \cdots \tau_n](v) : ((\mu\alpha :\overset{\phi}{0} .\tau_0)\tau_1 \ldots \tau_n) :\overset{\phi}{0}) = \text{erase}(v([\alpha \mapsto \mu\alpha :\overset{\phi}{0} .\tau_0]\tau_0)\tau_1 \ldots \tau_n :\overset{\phi}{0}) = \langle\rangle$.
- Case: $\lambda x : \tau \overset{\phi,\text{limit}}{\longrightarrow} e$. By (T-ABS), $\lambda x : \tau \overset{\phi,\text{limit}}{\longrightarrow} e : \tau_1 \overset{\phi,\text{limit}}{\mapsto} \tau_2$. If $\text{limit} = \infty$, by (K-ABS), $\tau_1 \overset{\phi,\infty}{\mapsto} \tau_2 :\overset{\phi}{1}$. This does not have Kind $\overset{\phi}{0}$. If $\text{limit} = I$, by (K-ABS), $\tau_1 \overset{\phi,\infty}{\mapsto} \tau_2 :\overset{\phi}{0}$ and by (ER-FUNI) $\text{erase}(\lambda x : \tau \overset{\phi,I}{\longrightarrow} e) = \langle\rangle$.
- Case: $\phi\langle\overrightarrow{v}\rangle$. BY (ER-TUPLEv0), $\text{erase}(\phi\langle\overrightarrow{v}\rangle : \tau :\overset{\phi}{0}) = \langle\rangle$.
- Case: $\text{union}(b, \tau_1, \tau_2, v)$. By (T-UNION), $\tau_1 : K$ and $\tau_2 : K$ and $v : \tau_i$ where $i = 1$ if b and $i = 2$ if $\neg b$ and $\text{union}(b, \tau_1, \tau_2, v) : \text{Union}(b, \tau_1, \tau_2)$. Therefore $v : \tau_i : K$. By induction, if $v : t :\overset{\phi}{0}$, $\text{erase}(v) = \langle\rangle$. By (K-UNION), $\text{Union}(b, \tau_1, \tau_2) : K$. By (ER-UNION), $\text{erase}(\text{union}(b, \tau_1, \tau_2, v)) = \text{erase}(v)$. If $K =\overset{\phi}{0}$, $\text{erase}(\text{union}(b, \tau_1, \tau_2, v) : \text{Union}(b, \tau_1, \tau_2) :\overset{\phi}{0}) = \text{erase}(v : \tau_i :\overset{\phi}{0}) = \langle\rangle$.
- Case: fact. By (ER-FACT) $\text{erase}(\text{fact}) = \langle\rangle$.

8.1.6 LEMMA [TYPE-SUBSTITUTION-VALUE]

$[\alpha \mapsto \tau]v$ is a value. Proof by induction on the values.

8.1.7 LEMMA [TERM-SUBSTITUTION-VALUE]

$[x \mapsto v]v$ and $[x \mapsto \text{fix}\, x.v]v$ are values. Proof by induction on the values.

8.2 THEOREM [Erasure-Progress-1]

$$\frac{C \vdash (M, e : \tau) \quad (M, e) \mapsto (M', e')}{\text{erase}((M, e)) \overset{?}{\mapsto} \text{erase}((M', e'))}$$

If (M, e) evaluates in one step to (M', e'), then $\text{erase}((M, e))$ evaluates in zero or one steps to $\text{erase}((M', e'))$. Proof by induction on the typed evaluation rules. There are several cases for this proof. For each, we list the evaluation rules which follow the case and show one proof. The other proofs in each case can be obtained using a similar proof to the example.

8.2.1 Case: $(M,e) \mapsto (M',e')$ using a typed evaluation rule and erase$((M,e)) \mapsto$ erase$((M',e'))$ using the corresponding untyped (or typed) evaluation rule.

1. $(E-LOAD)$If $e \overset{(E-LOAD)}{\mapsto} e'$ then $(M,e) = (M, \text{load}(i, \text{fact}))$ and $(M',e') = (M, ^\wedge \langle M(i), \text{fact}\rangle)$.
2. $(E-STORE)$ If $e \overset{(E-STORE)}{\mapsto} e'$ then $(M,e) = (M, \text{store}(i, \text{fact}, v))$ and $(M',e') = ([i \mapsto v]M, \text{fact})$.
3. $(E-ABSAPP2)$ If $e \overset{(E-ABSAPP2)}{\mapsto} e'$ then $e = (\lambda x : \tau \overset{\phi,\infty}{\longrightarrow} e_1)v_2$ and $e' = [x \mapsto v_2]e_1$.
4. $(E-LET)$ If $e \overset{(E-LET)}{\mapsto} e'$ then $e = \text{let}\,\langle x_1, \ldots, x_n\rangle = \phi\langle v_{1,\ldots,v_n}\rangle\,\text{in}\,e_1$ and $e' = [x_1 \mapsto v_1, \ldots, x_n \mapsto v_n]e_1$.
5. $(E-SIMPLIFY1)$ If $e \overset{(E-SIMPLIFY1)}{\mapsto} e'$ then $e = v_1\,\text{op}\,v_2$ and $e' = \text{simplify}(v_1\,\text{op}\,v_2)$.
6. $(E-SIMPLIFY2)$ If $e \overset{(E-SIMPLIFY2)}{\mapsto} e'$ then $e = \neg v$ and $e' = \text{simplify}(\neg v)$.
7. $(E-IF1)$ If $e \overset{(E-IF1)}{\mapsto} e'$ then $e = \text{if}\,true\,\text{then}\,e_1\,\text{else}\,e_2$ and $e' = e_1$.
8. $(E-IF2)$ If $e \overset{(E-IF1)}{\mapsto} e'$ then $e = \text{if}\,false\,\text{then}\,e_1\,\text{else}\,e_2$ and $e' = e_2$.

Proof :

$(E-ABSAPP2)$ If $e \overset{(E-ABSAPP2)}{\mapsto} e'$ then $e = (\lambda x : \tau \overset{\phi,\infty}{\longrightarrow} e_1)v_2$ and $e' = [x \mapsto v_2]e_1$. erase(e) = erase$((\lambda x : \tau \overset{\phi,\infty}{\longrightarrow} e_1)v_2)$= erase$(\lambda x : \tau \overset{\phi,\infty}{\longrightarrow} e_1)$erase$(v_2)$ by (ER-APP). This equals $(\lambda x \longrightarrow \text{erase}(e_1))\,\text{erase}(v_2)$ by (ER-FUN). erase(e') = erase$([x \mapsto v_2]e_1)$= $[x \mapsto \text{erase}(v_2)]\,\text{erase}(e_1)$ by Erase-Term-Substitution. Finally, $(\lambda x \longrightarrow \text{erase}(e_1))\,\text{erase}(v_2) \overset{(U-ABSAPP)}{\mapsto} [x \mapsto \text{erase}(v_2)]\,\text{erase}(e_1)$ so erase$(e) \mapsto$ erase(e').

8.2.2 Case: erase(e) = erase(e').

1. $(E-TAPPTABS)$ If $e \overset{(E-TAPPTABS)}{\mapsto} e'$ then $e = (\Lambda\alpha : K; B.v)\tau$ and $e' = [\alpha \mapsto \tau]v$.
2. $(E-UNROLL)$ If $e \overset{(E-UNROLL)}{\mapsto} e'$ then $e = \text{unroll}(\text{roll}[\tau](v))$ and $e' = v$.
3. $(E-CASE)$ If $e \overset{(E-CASE)}{\mapsto} e'$ then $e = \text{case}(b, \text{union}(b, \tau_1, \tau_2, v))$ and $e' = v$.
4. $(E-MAKEEQ)$ If $e \overset{(E-MAKEEQ)}{\mapsto} e'$ then $e = \text{make\_eq}(\tau)$ and $e' = \text{fact}$.
5. $(E-NEWFUN)$ If $e \overset{(E-NEWFUN)}{\mapsto} e'$ then $e = \text{new\_fun}(K)$ and $e' = \text{pack}[F^K, \text{fact}]\,\text{as}\,\exists\alpha : \text{int} \mapsto K.\text{FunGen}(\alpha, 0)$, where F^K is fresh.

Proof :

$(E-TAPPTABS)$ If $e \overset{(E-TAPPTABS)}{\mapsto} e'$ then $e = (\Lambda\alpha : K; B.v)\tau$ and $e' = [\alpha \mapsto \tau]v$. erase$(e)$ = erase$((\Lambda\alpha : K; B.v)\tau)$= erase$(\Lambda\alpha : K; B.v)$ by (ER-APPT). This equals erase(v) by (ER-TFUN). erase(e') = erase$([\alpha \mapsto \tau]v)$ = erase(v) by Erase-Type-Substitution so erase(e) = erase(e').

8.2.3 Case: erase$((M,e)) \mapsto$ erase$((M',e'))$ using (E-LET).

1. $(E-ABSAPP1)$ If $e \overset{(E-ABSAPP1)}{\mapsto} e'$ then $e = (\lambda x : \tau \overset{\phi,I}{\longrightarrow} e_1)v_2$ and $e' = \text{coerce}([x \mapsto v_2]e_1)$.
2. $(E-APPLYEQ)$ If $e \overset{(E-APPLYEQ)}{\mapsto} e'$ then $e = \text{apply\_eq}(\tau, \text{fact}, v)$ and $e' = v$.
3. $(E-INDOMAIN)$ If $e \overset{(E-INDOMAIN)}{\mapsto} e'$ then $e = \text{in\_domain}(I_1, I_2, \text{fact}, \text{fact})$ and $e' = ^\wedge \langle \text{know}(0 \le I_1 \wedge I_1 < I_2), \text{fact}\rangle$.

4. $(E-DISTINGUISH)$ If $e \overset{(E-DISTINGUISH)}{\mapsto} e'$ then $e = \text{distinguish}(I_1, I_2, \text{fact}, \text{fact})$ and $e' =^\wedge \langle \text{know}(I_1 \neq I_2), \text{fact}, \text{fact}\rangle$.

5. $(E-DISCARDFUN)$ If $e \overset{(E-DISCARDFUN)}{\mapsto} e'$ then $e = \text{discard\_fun}(\text{fact})$ and $e' = \cdot\langle\rangle$.

6. $(E-DEFINEFUN)$ If $e \overset{(E-DEFINEFUN)}{\mapsto} e'$ then $e = \text{define\_fun}(\text{fact}, \tau)$ and $e' =^\wedge \langle \text{fact}, \text{fact}, \text{fact}\rangle$.

Proof :

$(E-DEFINEFUN)$ If $e \overset{(E-DEFINEFUN)}{\mapsto} e'$ then $e = \text{define\_fun}(\text{fact}, \tau)$ and $e' =^\wedge \langle \text{fact}, \text{fact}, \text{fact}\rangle$. $\text{erase}(e) = \text{erase}(\text{define\_fun}(\text{fact}, \tau)) = \text{let } x = \text{erase}(\text{fact}) \text{ in } \langle\rangle$ by (ER-DEFINEFUN). This equals $\text{let } x = \langle\rangle \text{ in } \langle\rangle$ by (ER-FACT) and evaluates to $\langle\rangle$ using (E-LET). $\text{erase}(e') = \text{erase}(^\wedge\langle \text{fact}, \text{fact}, \text{fact}\rangle) = \langle\rangle$ by (ER-TUPLEv0) so $\text{erase}(e) \mapsto \text{erase}(e')$.

8.2.4 Case: $\textbf{erase}((M, e)) \overset{?}{\mapsto} \textbf{erase}((M', e'))$ using congruence.

1. $(Congruence\ rule) E[e] = e\tau \mid \text{pack}[\tau_1, e] \text{ as } \exists\alpha : K; B.\tau_2 \mid \text{unpack } \alpha, x = e \text{ in } e_2$
$\mid \text{roll}[\tau](e) \mid \text{unroll}(e) \mid ee_2 \mid v_1 e \mid \phi\langle v_1, \cdots, v_{k-1}, e, e_{k+1}, \cdots, e_n\rangle \mid \text{let } \overrightarrow{x} = e \text{ in } e_2$
$\mid e \text{ op } e_2 \mid v_1 \text{ op } e \mid \neg e \mid \text{if } e \text{ then } e_2 \text{ else } e_3 \mid \text{union}(b, \tau_1, \tau_2, e) \mid \text{case}(b, e) \mid \text{load}(e, e_{\text{Has}})$
$\mid \text{store}(e, e_{\text{Has}}, e_v) \mid \text{store}(\text{v}_{\text{ptr}}, \text{v}_{\text{Has}}, e) \mid \text{apply\_eq}(\tau, e, e_2) \mid \text{apply\_eq}(\tau, \text{v}_1, e) \mid \text{discard\_fun}(e)$
$\mid \text{load}(v_{\text{ptr}}, e) \mid \text{store}(\text{v}_{\text{ptr}}, e, e_v) \mid \text{coerce}(e)$

Proof :

$(Congruence\ rule)$ If $(M, e) \overset{(congruence\ rule) E[e]=e\tau}{\mapsto} (M', e')$ then $e = e_1\tau$ and $e' = e_1'\tau$ and $(M, e_1) \mapsto (M', e_1')$. By induction, $\text{erase}((M, e_1)) \overset{?}{\mapsto} \text{erase}((M', e_1'))$. $\text{erase}((M, e)) = \text{erase}((M, e_1\tau)) = (\text{erase}(M), \text{erase}(e_1\,\tau)$ $= (\text{erase}(M), \text{erase}(e_1))$ by (ER-M) and (ER-APPT). $\text{erase}((M', e')) = \text{erase}((M', e_1'\tau)) = (\text{erase}(M'), \text{erase}(e_1'\,\tau) =$ $(\text{erase}(M'), \text{erase}(e_1'))$ by (ER-M) and (ER-APPT). Finally, $\text{erase}((M, e_1)) = (\text{erase}(M), \text{erase}(e_1))$ and $\text{erase}(M', e_1') =$ $(\text{erase}(M'), \text{erase}(e_1')$ by (ER-M), so $(\text{erase}(M), \text{erase}(e_1)) \overset{?}{\mapsto} (\text{erase}(M'), \text{erase}(e_1'))$ and $\text{erase}((M, e)) \overset{?}{\mapsto} \text{erase}((M', e'))$.

8.2.5 Case: $\textbf{erase}((M, e)) = \textbf{erase}((M', e'))$ using Zero-Erase-Value.

1. $(E-COERCE)$ If $e \overset{(E-COERCE)}{\mapsto} e'$ then $e = \text{coerce}(v)$ and $e' = v$.

Proof :

$\text{erase}(e) = \text{erase}(\text{coerce}(v)) = \langle\rangle$ by (ER-COERCE). $\text{erase}(e') = \text{erase}(v) = \langle\rangle$ by Zero-Erase-Value. $\langle\rangle = \langle\rangle$ so $\text{erase}(e) = \text{erase}(e')$.

8.2.6 Case: $\textbf{erase}((M, e)) \overset{?,(congruence\ rule) E[e]=\textbf{let } x=e \textbf{ in } e_2}{\mapsto} \textbf{erase}((M', e'))$.

1. $(Congruence\ rule) E[e] = \text{distinguish}(I_1, I_2, e, e_2) \mid \text{distinguish}(I_1, I_2, \text{v}_1, e) \mid \text{define\_fun}(e, \tau)$
$\mid \text{in\_domain}(I_1, I_2, e, e_2) \mid \text{in\_domain}(I_1, I_2, \text{v}_1, e)$

Proof :

$(Congruence\ rule)$If $(M, e) \overset{(congruence\ rule) E[e]=\text{distinguish}(I_1, I_2, e, e_2)}{\mapsto} (M', e')$ then $e = \text{distinguish}(I_1, I_2, e_1, e_2)$ and $e' = \text{distinguish}(I_1, I_2, e_1', e_2)$ and $(M, e_1) \mapsto (M', e_1')$. By induction, $\text{erase}((M, e_1)) \overset{?}{\mapsto} \text{erase}((M', e_1'))$. $\text{erase}((M, e)) =$ $\text{erase}((M, \text{distinguish}(I_1, I_2, e_1, e_2))) = (\text{erase}(M), \text{erase}(\text{distinguish}(I_1, I_2, e_1, e_2)))$ by (ER-M). This equals $(\text{erase}(M), \text{let } \langle x, y\rangle = \langle \text{erase}(e_1), \text{erase}(e_2)\rangle \text{ in } \langle\rangle)$ by (ER-DISTINGUISH). $\text{erase}((M', e'))$ $= \text{erase}((M', \text{distinguish}(I_1, I_2, e_1', e_2))) = (\text{erase}(M'), \text{erase}(\text{distinguish}(I_1, I_2, e_1, e_2)))$ by (ER-M). This equals $(\text{erase}(M'), \text{let } \langle x, y\rangle = \langle \text{erase}(e_1'), \text{erase}(e_2)\rangle \text{ in } \langle\rangle)$ by (ER-DISTINGUISH). Finally, $\text{erase}((M, e_1)) = (\text{erase}(M), \text{erase}(e_1))$ and $\text{erase}(M', e_1') = (\text{erase}(M'), \text{erase}(e_1')$ by (ER-M), so $(\text{erase}(M), \text{erase}(e_1)) \overset{?}{\mapsto} (\text{erase}(M'), \text{erase}(e_1'))$ and

$(\text{erase}(M), \langle \text{erase}(e_1), \text{erase}(e_2)\rangle) \overset{?,(congruence\ rule) E[e]=\phi\langle v_1, \cdots, v_{k-1}, e, e_{k+1}, \cdots, e_n\rangle}{\mapsto} (\text{erase}(M'), \langle \text{erase}(e_1'), \text{erase}(e_2)\rangle)$

so, $(\text{erase}(M), \text{let } \langle x, y\rangle = \langle \text{erase}(e_1), \text{erase}(e_2)\rangle \text{ in } \langle\rangle) \overset{?,(congruence\ rule) E[e]=\text{let } x=e \text{ in } e_2}{\mapsto}$
$(\text{erase}(M'), \text{let } \langle x, y\rangle = \langle \text{erase}(e_1'), \text{erase}(e_2)\rangle \text{ in } \langle\rangle)$.

8.2.7 Case: unpack.

1. $(E-UNPACK)$ If $e \overset{(E-UNPACK)}{\mapsto} e'$ then $e = \text{unpack}\,\alpha, x = (\text{pack}[\tau_1, v_1]\,\text{as}\,\tau_2)\,\text{in}\,e_2$ and $e' = [\alpha \mapsto \tau_1, x \mapsto v_1]e_2$.

Proof :
$\text{erase}(e) = \text{erase}(\text{unpack}\,\alpha, x = (\text{pack}[\tau_1, v_1]\,\text{as}\,\tau_2)\,\text{in}\,e_2)$ equals $\text{let}\,x = \text{erase}(\text{pack}[\tau_1, v_1]\,\text{as}\,\tau_2)\,\text{in}\,\text{erase}(e_2)$ by (ER-UNPACK). This equals $\text{let}\,x = \text{erase}(v_1)\,\text{in}\,\text{erase}(e_2)$ by (ERPACK). $\text{erase}(e') = \text{erase}([\alpha \mapsto \tau_1, x \mapsto v_1]e_2) = [x \mapsto \text{erase}(v_1)]\,\text{erase}(e_2)$ by Erase-Term-Substitution and Erase-Type-Substitution. Finally, $\text{let}\,x = \text{erase}(v_1)\,\text{in}\,\text{erase}(e_2) \overset{(E-LET)}{\mapsto} [x \mapsto \text{erase}(v_1)]\,\text{erase}(e_2)$ so $\text{erase}(e) \mapsto \text{erase}(e')$.

8.2.8 Case: erase$((M, e))$ $\overset{(U-FIX)}{\mapsto}$ erase$((M', e'))$.

1. $(E-FIX)$ If $e \overset{(E-FIX)}{\mapsto} e'$ then $e = \text{fix}\,x : \tau.v$ and $e' = [x \mapsto \text{fix}\,x : \tau.v]v$.

By the type checking rules, x and v are the same size. If $x : t \overset{\phi}{:} 0$, $e = \text{fix}\,x : t \overset{\phi}{:} 0\ .v$ and $e' = [x \mapsto \text{fix}\,x : t \overset{\phi}{:} 0\ .v]v$. $\text{erase}(e) = \text{erase}(\text{fix}\,x : t \overset{\phi}{:} 0\ .v) = \langle\rangle$ by (ER-FIX0). $\text{erase}(e') = \text{erase}([x \mapsto \text{fix}\,x : t \overset{\phi}{:} 0\ .v]v) = [x \mapsto \text{erase}(\text{fix}\,x : t \overset{\phi}{:} 0\ .v)]\,\text{erase}(v)$ by Erase-Term-Substitution. This equals $[x \mapsto \langle\rangle]\langle\rangle$ by (ER-FIX0) and Zero-Erase-Value. This equals $\langle\rangle$. Therefore, $\text{erase}(e) = \text{erase}(e')$.

If $x : t \overset{\phi}{:} i$ where $i > 0$, $e = \text{fix}\,x : t \overset{\phi}{:} i\ .v$ and $e' = [x \mapsto \text{fix}\,x : t \overset{\phi}{:} i\ .v]v$. $\text{erase}(e) = \text{erase}(\text{fix}\,x : t \overset{\phi}{:} i\ .v) = \text{fix}\,x.\,\text{erase}(v)$ by (ER-FIX). $\text{erase}(e') = \text{erase}([x \mapsto \text{fix}\,x : t \overset{\phi}{:} i\ .v]v) = [x \mapsto \text{erase}(\text{fix}\,x : t \overset{\phi}{:} i\ .v)]\,\text{erase}(v)$ by Erase-Term-Substitution. This equals $[x \mapsto \text{fix}\,x.v]\,\text{erase}(v)$ by (ER-FIX). And $\text{fix}\,x.\,\text{erase}(v) \overset{(U-FIX)}{\mapsto} [x \mapsto \text{fix}\,x.\,\text{erase}(v)]\,\text{erase}(v)$ so $\text{erase}(e) \mapsto \text{erase}(e')$.

8.2.9 Case: These only appear in coersion functions and erase does not apply to them.

1. $(E-IFB1)$ If $e \overset{(E-IFB1)}{\mapsto} e'$ then $\vdash B \doteq true$ and $e = \text{if}\,B\,\text{then}\,e_1\,\text{else}\,e_2$ and $e' = e_1$.
2. $(E-IFB2)$ If $e \overset{(E-IFB2)}{\mapsto} e'$ then $\vdash B \doteq false$ and $e = \text{if}\,B\,\text{then}\,e_1\,\text{else}\,e_2$ and $e' = e_2$.

8.3 c Set

c is the set of expressions e which erase to a value.

$$c = i \mid b \mid c\tau \mid \phi\langle\overrightarrow{c}\rangle : \overrightarrow{\tau} \overset{\phi}{:} i \text{ where } i > 0 \mid \phi\langle\overrightarrow{v}\rangle : \overrightarrow{\tau} \overset{\phi}{:} 0 \mid \lambda x : \tau \overset{\phi,\text{limit}}{\longrightarrow} e$$

$$\mid \Lambda\alpha : K; B.v \mid \text{union}(b, \tau_1, \tau_2, c) \mid \text{pack}[\tau_1, c]\,\text{as}\,\exists\alpha : K; B.\tau_2$$

$$\mid \text{case}(b, c) \mid \text{roll}[(\mu\alpha : K.\tau_0)\tau_1 \cdots \tau_n](c) \mid \text{unroll}(c) \mid \text{fix}\,x : \tau \overset{\phi}{:} 0\ .\text{v}$$

$$\mid \text{coerce}(e) \mid \text{make\_eq}(\tau) \mid \text{new\_fun}(K) \mid \text{fact}$$

8.3.1 LEMMA [C-ERASE-VALUE]

$\text{erase}(c) = u$. Proof by induction on c.

1. By (ER-i), $\text{erase}(i) = i$.
2. By (ER-b), $\text{erase}(b) = b$.
3. By (ER-APPT), $\text{erase}(c\tau) = \text{erase}(c)$.

4. By (ER-TUPLE), $\text{erase}(\phi\langle\overrightarrow{c}\rangle : \overrightarrow{\tau} :^{\phi}_{i}) = \langle\overrightarrow{\text{erase}(c)}\rangle$.
5. By (ER-TUPLEv0), $\text{erase}(\phi\langle\overrightarrow{v}\rangle : \overrightarrow{\tau} :^{\phi}_{0}) = \langle\rangle$.
6. By (ER-FUN), $\text{erase}(\lambda x : \tau \xrightarrow{\phi,\infty} e) = \lambda x \longrightarrow \text{erase}(e)$.
7. By (ER-FUNI), $\text{erase}(\lambda x : \tau \xrightarrow{\phi,I} e) = \langle\rangle$.
8. By (ER-TFUN), $\text{erase}(\Lambda\alpha : K; B.v) = \text{erase}(v)$. By Value-Erase-Value, $\text{erase}(v) = u$.
9. By (ER-UNION), $\text{erase}(\text{union}(b, \tau_1, \tau_2, c)) = \text{erase}(c)$.
10. By (ER-PACK), $\text{erase}(\text{pack}[\tau_1, c]\,\text{as}\,\exists\alpha : K; B.\tau_2) = \text{erase}(c)$.
11. By (ER-CASE), $\text{erase}(\text{case}(b, c)) = \text{erase}(c)$.
12. By (ER-ROLL), $\text{erase}(\text{roll}[(\mu\alpha : K.\tau_0)\tau_1 \cdots \tau_n](c)) = \text{erase}(c)$.
13. By (ER-UNROLL), $\text{erase}(\text{unroll}(c)) = \text{erase}(c)$.
14. By (ER-FIX0), $\text{erase}(\text{fix}\, x : \tau :^{\phi}_{0} .\text{v}) = \langle\rangle$.
15. By (ER-COERCE), $\text{erase}(\text{coerce}(e)) = \langle\rangle$.
16. By (ER-MAKEEQ), $\text{erase}(\text{make\_eq}(\tau)) = \langle\rangle$.
17. By (ER-NEWFUN), $\text{erase}(\text{new\_fun}(K)) = \langle\rangle$.
18. By (ER-FACT), $\text{erase}(\text{fact}) = \langle\rangle$.

$\text{erase}(c)$ is either a value or another $\text{erase}(c)$. In the case of $\langle\overrightarrow{\text{erase}(c)}\rangle$, each $\text{erase}(c)$ will eventually erase to a value and a tuple of values is a value.

8.3.2 LEMMA [NON-C-ERASE-NON-VALUE]

If $e \neq c$ then, $\text{erase}(e) \neq u$. Proof by induction on the expressions.

1. By (ER-x), $\text{erase}(x) = x$.
2. By (ER-APP), $\text{erase}(e_1 : (\tau_1 \xrightarrow{\phi,\infty} \tau_2)\, e_2) = \text{erase}(e_1)\,\text{erase}(e_2)$.
3. By (ER-APPI), $\text{erase}(e_1 : (\tau_1 \xrightarrow{\phi,I} \tau_2)\, e_2) = \text{let}\, x = \langle\,\text{erase}(e_1), \text{erase}(e_2)\rangle\,\text{in}\,\langle\rangle$.
4. By (ER-TUPLEe0), $\text{erase}(\phi\langle\overrightarrow{e}\rangle : \overrightarrow{\tau} :^{\phi}_{0}) = \text{let}\, x = \langle\overrightarrow{\text{erase}(e)}\rangle\,\text{in}\,\langle\rangle$.
5. By (ER-OP), $\text{erase}(e_1\,\text{op}\,e_2) = \text{erase}(e_1)\,\text{op}\,\text{erase}(e_2)$.
6. By (ER-NOT), $\text{erase}(\neg e) = \neg\,\text{erase}(e)$.
7. By (ER-LET), $\text{erase}(\text{let}\,\langle\overrightarrow{x}\rangle = e_1\,\text{in}\,e_2) = \text{let}\,\langle\overrightarrow{x}\rangle = \text{erase}(e_1)\,\text{in}\,\text{erase}(e_2)$.
8. By (ER-IF), $\text{erase}(\text{if}\,e_1\,\text{then}\,e_2\,\text{else}\,e_3) = \text{if}\,\text{erase}(e_1)\,\text{then}\,\text{erase}(e_2)\,\text{else}\,\text{erase}(e_3)$.
9. Since $\text{if}\,B\,\text{then}\,e_1\,\text{else}\,e_2$ is only found inside coersion functions, erase does not apply to it.
10. By (ER-UNION), $\text{erase}(\text{union}(b, \tau_1, \tau_2, e))\,\text{where}\,e \neq c = \text{erase}(e)\,\text{where}\,e \neq c$.
11. By (ER-PACK), $\text{erase}(\text{pack}[\tau_1, e]\,\text{as}\,\exists\alpha : K; B.\tau_2)\,\text{where}\,e \neq c = \text{erase}(e)\,\text{where}\,e \neq c$.
12. By (ER-UNPACK), $\text{erase}(\text{unpack}\,\alpha, x = e_1\,\text{in}\,e_2) = \text{let}\,x = \text{erase}(e_1)\,\text{in}\,\text{erase}(e_2)$.

13. By (ER-CASE), $\text{erase}(\text{case}(b, e))$ where $e \neq c = \text{erase}(e)$ where $e \neq c$.
14. By (ER-ROLL), $\text{erase}(\text{roll}[(\mu\alpha : K.\tau_0)\tau_1 \ldots \tau_n](e))$ where $e \neq c = \text{erase}(e)$ where $e \neq c$.
15. By (ER-UNROLL), $\text{erase}(\text{unroll}(e))$ where $e \neq c = \text{erase}(e)$ where $e \neq c$.
16. By (ER-FIX), $\text{erase}(\text{fix}\, x : \tau :\overset{\phi}{i}\, .\text{v where } i > 0) = \text{fix}\, x.\, \text{erase}(v)$.
17. By (ER-LOAD), $\text{erase}(\text{load}(e_{\text{ptr}}, e_{\text{Has}})) = \text{load}(\text{erase}(e_{ptr}), \text{erase}(e_{Has}))$.
18. By (ER-STORE), $\text{erase}(\text{store}(e_{\text{ptr}}, e_{\text{Has}}, \text{e}_{\text{v}})) = \text{store}(\text{erase}(e_{ptr}), \text{erase}(e_{Has}), \text{erase}(e_v))$.
19. By (ER-DISTINGUISH), $\text{erase}(\text{distinguish}(I_1, I_2, e_1, e_2)) = \text{let}\, \langle x, y\rangle = \langle \text{erase}(e_1), \text{erase}(e_2)\rangle \,\text{in}\, \langle\rangle$.
20. By (ER-APPLYEQ), $\text{erase}(\text{apply\_eq}(\tau, e_1, e_2)) = \text{let}\, \langle x, y\rangle = \langle \text{erase}(e_1), \text{erase}(e_2)\rangle \,\text{in}\, y$.
21. By (ER-DISCARDFUN), $\text{erase}(\text{discard\_fun}(e)) = \text{let}\, x = \text{erase}(e) \,\text{in}\, \langle\rangle$.
22. By (ER-DEFINEFUN), $\text{erase}(\text{define\_fun}(e, \tau)) = \text{let}\, x = \text{erase}(e) \,\text{in}\, \langle\rangle$.
23. By (ER-INDOMAIN), $\text{erase}(\text{in\_domain}(I_1, I_2, e_1, e_2)) = \text{let}\, \langle x, y\rangle = \langle \text{erase}(e_1), \text{erase}(e_2)\rangle \,\text{in}\, \langle\rangle$.

All expressions which are not in c erase to non values (or do not erase).

8.3.3 csize function

Define $\text{csize}(c)$ as:

- $\text{csize}(c\tau) = 1 + \text{csize}(c)$
- $\text{csize}(\phi\langle\overrightarrow{c}\rangle : \overrightarrow{\tau} :\overset{\phi}{i}) \text{ where } i > 0 = 1 + \text{csize}(c)$
- $\text{csize}(\text{union}(b, \tau_1, \tau_2, c)) = 1 + \text{csize}(c)$
- $\text{csize}(\text{pack}[\tau_1, c] \,\text{as}\, \exists\alpha : K; B.\tau_2) = 1 + \text{csize}(c)$
- $\text{csize}(\text{case}(b, c)) = 1 + \text{csize}(c)$
- $\text{csize}(\text{roll}[(\mu\alpha : K.\tau_0)\tau_1 \cdots \tau_n](c)) = 1 + \text{csize}(c)$
- $\text{csize}(\text{unroll}(c)) = 1 + \text{csize}(c)$
- $\text{csize}(\text{fix}\, x : \tau :\overset{\phi}{0}\, .\text{v}) = 1$
- $\text{csize}(\text{coerce}(e)) = 1$
- $\text{csize}(\text{make\_eq}(\tau)) = 1$
- $\text{csize}(\text{new\_fun}(K)) = 1$
- $\text{csize}(\text{discard\_fun}(e)) = 1$
- $\text{csize}(v) = 0$

8.3.4 LEMMA [C-SIZE-DECREASES]

If $C \vdash c : \tau$, where C has an empty Δ and Γ, and (M, c) steps, then there is some c' so that $(M, c) \stackrel{+}{\mapsto} (M, c')$ and csize(c) > csize(c'). Proof by induction on the possible evaluation rules. In all cases except coerce-congruence, we reach c' by taking only one step. The coerce-congruence case relies on strong normalization, and may take many steps.

1. coerce$(v) \stackrel{(E-COERCE)}{\mapsto} v$. csize(coerce$(v)$) > csize$(v)$.
2. $(\Lambda\alpha : K; B.v)\tau \stackrel{(E-TAPPTABS)}{\mapsto} [\alpha \mapsto \tau]v$. csize$((\Lambda\alpha : K; B.v)\tau) = 1$. By Type-Substitution-Value, $[\alpha \mapsto \tau]v$ is a value so csize$([\alpha \mapsto \tau]v) = 0$.
3. unroll(roll$[\tau](v)) \stackrel{(E-UNROLL)}{\mapsto} v$. csize(unroll(roll$[\tau](v))) > 0$.
4. $\mathrm{fix}\, x : t \stackrel{\phi}{:} 0\ .v \stackrel{(E-FIX)}{\mapsto} [x \mapsto \mathrm{fix}\, x : t \stackrel{\phi}{:} 0\ .v]v$. By Term-Substitution-Value, $[x \mapsto \mathrm{fix}\, x : t \stackrel{\phi}{:} 0\ .v]v$ is a value. csize$(\mathrm{fix}\, x : t \stackrel{\phi}{:} 0) = 1 > 0$
5. case$(b, \mathrm{union}(b, \tau_1, \tau_2, v)) \stackrel{(E-CASE)}{\mapsto} v$. csize(case$(b, \mathrm{union}(b, \tau_1, \tau_2, v))) = 2 > 0$.
6. make_eq$(\tau) \stackrel{(E-MAKEEQ)}{\mapsto}$ fact. csize(make_eq$(\tau)) = 1 > 0$.
7. new_fun$(K) \stackrel{(E-NEWFUN)}{\mapsto}$ pack$[F^K, \mathrm{fact}]\,\mathrm{as}\,\exists\alpha : \mathrm{int} \mapsto K.\mathrm{FunGen}(\alpha, 0)$, where F^K is fresh. csize(new_fun$(K)) = 1 > 0$.
8. discard_fun(fact) $\stackrel{(E-DISCARDFUN)}{\mapsto} \cdot\langle\rangle$. csize(discard_fun(fact)) $= 1 > 0$.
9. $c \stackrel{(congruence\ rule) c = E[c_1]}{\mapsto} c'$. By induction, $(M, c_1) \mapsto (M, c_1')$ and csize(c_1) > csize(c_1') so csize$(E[c_1])$ > csize$(E[c_1'])$.
10. coerce$(e_1) \stackrel{(congruence\ rule) e = E[e_1]}{\mapsto}$ coerce(e_1'). By inversion, e_1 type-checks in an environment with $limit = i$ for some i. Therefore we can use strong normalization to say $(M, e_1) \stackrel{*}{\mapsto} (M, v_1)$. By congruence, $(M, \mathrm{coerce}(e_1)) \stackrel{*}{\mapsto} (M, \mathrm{coerce}(v_1))$. In one additional step, $(M, \mathrm{coerce}(v_1)) \stackrel{(E-COERCE)}{\mapsto} (M, v_1)$. Let $c' = v_1$, so that csize(c) = csize(coerce$(e_1))$ > csize(v_1) = csize(c').

8.3.5 LEMMA [C-*STEP-VALUE]

If $C \vdash c : \tau$, where C has an empty Δ and Γ, then $(M, c) \stackrel{*}{\mapsto} (M, v)$.

Proof: By Preservation and Progress, the C-Size-Decreases Lemma will repeatedly apply until a value is reached. This must happen eventually because csize() can only decrease finitely many times and only csize$(v) = 0$.

8.4 THEOREM [ERASURE-PROGRESS-2]

$$\frac{C \vdash (M, e : \tau)\ \mathrm{where}\ C\ \mathrm{has\ an\ empty}\ \Delta\ \mathrm{and}\ \Gamma \quad \mathrm{erase}(e)\ \mathrm{is\ a\ value}}{(M, e) \stackrel{*}{\mapsto} (M, v),\ \mathrm{erase}((M, e)) = \mathrm{erase}((M, v))}$$

If erase(e) is a value, then by Erase-C-Value, $e = c$. By C-*Step-Value, $(M, e) \stackrel{*}{\mapsto} (M, v)$. By Preservation, $e : \tau$ and $v : \tau$. Either $e = v$ and erase$((M, e))$ = erase$((M, v))$ or $e \neq v$ and $(M, e) \stackrel{+}{\mapsto} (M, v)$. If $e \neq v$, $e \mapsto e_1 \stackrel{\mathrm{repeatedly}}{\mapsto} e_n \mapsto v$. By Erasure-Progress-1, erase$((M, e)) \stackrel{?}{\mapsto}$ erase$((M, e_1)) \stackrel{?,\mathrm{repeatedly}}{\mapsto}$ erase$((M, e_n)) \stackrel{?}{\mapsto}$ erase$((M, v))$. Since erase(e) is a value, erase$((M, e))$ = erase$((M, e_1))$= erase$((M, e_n))$= erase$((M, v))$.

8.4.1 LEMMA [UNTYPED-NON-VALUES-STEP]

If $C \vdash (M, e : \tau)$ where C has an empty Δ and Γ and $\mathrm{erase}(e)$ is a non value, then $\mathrm{erase}((M,e)) \mapsto (L', d')$. Proof by induction on the expressions.

1. Case: $\mathrm{erase}(e)$ is a value.

$$e = i \mid b \mid \phi\langle \overrightarrow{v} \rangle : \tau :^{\phi}_{0} \mid \lambda x : \tau \stackrel{\phi,\mathrm{limit}}{\longrightarrow} e_1$$
$$\mid \Lambda\alpha : K; B.v \mid \mathrm{fix}\, x : \tau :^{\phi}_{0} .v \mid \mathrm{coerce}(e_1)$$
$$\mid \mathrm{make\_eq}(\tau) \mid \mathrm{new\_fun}(K) \mid \mathrm{fact}$$

2. Case: $e = x$. This won't typecheck in an empty environment.

3. Case: $e = \mathrm{if}\, B \,\mathrm{then}\, e_1 \,\mathrm{else}\, e_2$. This only appears inside coersion functions and will be removed by erase of the coersion function so erase does not apply to this case.

4. Case: $e = e_1\,\tau \mid \mathrm{union}(b, \tau_1, \tau_2, e_1) \mid \mathrm{pack}[\tau_1, e_1]\,\mathrm{as}\,\exists\alpha : K; B.\tau_2 \mid \mathrm{case}(b, e) \mid \mathrm{roll}[(\mu\alpha : K.\tau_0)\tau_1 \cdots \tau_n](e) \mid \mathrm{unroll}(e)$. The proofs for all of these are similar so we will only show one.
$e = e_1\,\tau$. By (ER-APPT), $\mathrm{erase}(e_1\,\tau) = \mathrm{erase}(e_1)$. If $e_1 = c$, by C-Erase-Value $\mathrm{erase}(e_1) = u$ so $\mathrm{erase}(e) = u$. If $e_1 \neq c$, e_1 is not a value. By Non-C-Erase-Non-Value $\mathrm{erase}(e_1) \neq u$. By induction, $\mathrm{erase}((M, e_1)) \mapsto (L', d')$. Therefore, $\mathrm{erase}((M,e)) \mapsto (L', d')$.

5. Case: $e = e_1\,e_2$.
If $e_1 : (\tau_1 \stackrel{\phi,\infty}{\mapsto} \tau_2)$, $\mathrm{erase}((M,e)) = (\,\mathrm{erase}(M),\, \mathrm{erase}(e_1)\,\mathrm{erase}(e_2))$ by (ER-M) and (ER-APP).
If e_1 is in the set c, then by C-*Step-Value, $(M, e_1) \stackrel{*}{\mapsto} (M, v_1)$. $(\,\mathrm{erase}(M),\, \mathrm{erase}(e_1)\,\mathrm{erase}(e_2)) \stackrel{*,(congruence\,rule)E[e]=e\,e_2}{\mapsto} (\,\mathrm{erase}(M),\, \mathrm{erase}(v_1)\,\mathrm{erase}(e_2))$. By Inversion and Canonical Forms, $v_1 = \lambda x : \tau_1 \stackrel{\phi,\infty}{\longrightarrow} e_{11}$. $\mathrm{erase}(v_1) = \lambda x \longrightarrow \mathrm{erase}(e_{11})$. If $\mathrm{erase}(e_2)$ is a value, then $(\,\mathrm{erase}(M), (\lambda x \longrightarrow \mathrm{erase}(e_{11}))\,\mathrm{erase}(e_2)) \stackrel{(U-ABSAPP)}{\mapsto} (\,\mathrm{erase}(M), [x \mapsto \mathrm{erase}(e_2)]\,\mathrm{erase}(e_{11}))$. If $\mathrm{erase}(e_2)$ is not a value, then by induction $\mathrm{erase}((M, e_2)) \mapsto (L', d_2)$. $(\,\mathrm{erase}(M),\, \mathrm{erase}(v_1)\,\mathrm{erase}(e_2)) \stackrel{(congruence\,rule)E[e]=v\,e}{\mapsto} (L',\, \mathrm{erase}(v_1)\,d_2)$.
If e_1 is not in the set c, then by Not-C-Erase-Not-Value $\mathrm{erase}(e_1)$ is a non value. By induction $\mathrm{erase}((M, e_1)) \mapsto (L', d_1)$. $(\,\mathrm{erase}(M),\, \mathrm{erase}(e_1)\,\mathrm{erase}(e_2)) \stackrel{(congruence\,rule)E[e]=e\,e_2}{\mapsto} (L', d_1\,\mathrm{erase}(e_2))$.

If $e_1 : (\tau_1 \stackrel{\phi,I}{\mapsto} \tau_2)$, $\mathrm{erase}((M,e)) = (\,\mathrm{erase}(M), \mathrm{let}\, x = \langle\,\mathrm{erase}(e_1),\, \mathrm{erase}(e_2)\rangle\,\mathrm{in}\,\langle\rangle)$ by (ER-M) and (ER-APPI).
If $\mathrm{erase}(e_1)$ is a value, if $\mathrm{erase}(e_2)$ is a value, then $\mathrm{let}\, x = \langle\,\mathrm{erase}(e_1),\, \mathrm{erase}(e_2)\rangle\,\mathrm{in}\,\langle\rangle \stackrel{(E-LET)}{\mapsto} \langle\rangle$. If $\mathrm{erase}(e_2)$ is not a value, then by induction $\mathrm{erase}((M, e_2)) \mapsto (L', d_2)$. $(\,\mathrm{erase}(M), \mathrm{let}\, x = \langle\,\mathrm{erase}(e_1),\, \mathrm{erase}(e_2)\rangle\,\mathrm{in}\,\langle\rangle) \stackrel{(congruence\,rule)E[e]=\phi\langle v_1,\cdots,v_{k-1},e,e_{k+1},\cdots,e_n\rangle}{\mapsto} (L', \mathrm{let}\, x = \langle\,\mathrm{erase}(e_1), d_2\rangle\,\mathrm{in}\,\langle\rangle)$.
If $\mathrm{erase}(e_1)$ is not a value, then by induction $\mathrm{erase}((M, e_1)) \mapsto (L', d_1)$. $(\,\mathrm{erase}(M), \mathrm{let}\, x = \langle\,\mathrm{erase}(e_1),\, \mathrm{erase}(e_2)\rangle\,\mathrm{in}\,\langle\rangle) \stackrel{(congruence\,rule)E[e]=\phi\langle v_1,\cdots,v_{k-1},e,e_{k+1},\cdots,e_n\rangle}{\mapsto} (L', \mathrm{let}\, x = \langle d_1,\, \mathrm{erase}(e_2)\rangle\,\mathrm{in}\,\langle\rangle)$.

6. Case: $e = \phi\langle\overrightarrow{e_1}\rangle$. If $e = \phi\langle\overrightarrow{e_1}\rangle : \overrightarrow{\tau_1} :^{\phi}_{i}$ where $i > 0$, by (ER-TUPLE) and (ER-M) $\mathrm{erase}((M,e)) = (\,\mathrm{erase}(M), \langle\,\mathrm{erase}(e_{11}), \ldots,\, \mathrm{erase}(e_{1n})\rangle)$. If $\mathrm{erase}(e)$ is a non value then some $\mathrm{erase}(e_{1i})$ is a non value. By induction, $\mathrm{erase}((M, e_{1i})) \mapsto (L', d_{1i})$. $(\,\mathrm{erase}(M), \langle\,\mathrm{erase}(e_{11}), \ldots,\, \mathrm{erase}(e_{1n})\rangle) \stackrel{(congruence\,rule)E[e]=\phi\langle v_1,\cdots,v_{k-1},e,e_{k+1},\cdots,e_n\rangle}{\mapsto} (L', \langle\,\mathrm{erase}(e_{11}), \ldots, d_{1i}, \ldots,\, \mathrm{erase}(e_{1n})\rangle)$. If $e = \phi\langle\overrightarrow{e_1}\rangle : \overrightarrow{\tau_1} :^{\phi}_{0}$, by (ER-TUPLEe0) and (ER-M) $\mathrm{erase}((M,e)) = (\,\mathrm{erase}(M), \mathrm{let}\, x = \phi\langle\overrightarrow{\mathrm{erase}(e_1)}\rangle\,\mathrm{in}\,\langle\rangle)$ where some $\mathrm{erase}(e_{1i})$ is not a value. By induction $\mathrm{erase}((M, e_{1i})) \mapsto (L', d_{1i})$. $(\,\mathrm{erase}(M), \langle\,\mathrm{erase}(e_{11}), \ldots,\, \mathrm{erase}(e_{1n})\rangle) \stackrel{(congruence\,rule)E[e]=\phi\langle v_1,\cdots,v_{k-1},e,e_{k+1},\cdots,e_n\rangle}{\mapsto} (L', \langle\,\mathrm{erase}(e_{11}), \ldots, d_{1i}, \ldots,\, \mathrm{erase}(e_{1n})\rangle)$.

7. Case: $e = e_1\,\mathrm{op}\,e_2 \mid \neg e_1 \mid \mathrm{if}\, e_1\,\mathrm{then}\, e_2\,\mathrm{else}\, e_3 \mid \mathrm{unpack}\,\alpha, x = e_1\,\mathrm{in}\,e_2$
$\mid \mathrm{load}(e_{\mathrm{ptr}}, e_{\mathrm{Has}}) \mid \mathrm{store}(e_{\mathrm{ptr}}, e_{\mathrm{Has}}, e_{\mathrm{v}}) \mid \mathrm{distinguish}(I_1, I_2, e_1, e_2) \mid \mathrm{apply\_eq}(\tau, e_1, e_2) \mid \mathrm{discard\_fun}(e_1) \mid \mathrm{define\_fun}(e_1, \tau)$
$\mid \mathrm{in\_domain}(I_1, I_2, e_1, e_2)$.

Proof :
$e = \text{if}\, e_1 \,\text{then}\, e_2 \,\text{else}\, e_3$. By (ER-IF) and (ER-M), $\text{erase}((M,e)) = (\,\text{erase}(M), \text{if}\, \text{erase}(e_1)\, \text{then}\, \text{erase}(e_2)\, \text{else}\, \text{erase}(e_3))$. If e_1 is in the set c, then by (C-*Step-Value) $(M,e_1) \stackrel{*}{\mapsto} (M,v_1)$. Since $v_1 : Bool(B)$, $v_1 = b$ by Canonical Forms. So, $\text{erase}(v_1) = b$ by (ER-b). If $b = true$ then $(\,\text{erase}(M), \text{if}\, \text{erase}(e_1)\, \text{then}\, \text{erase}(e_2)\, \text{else}\, \text{erase}(e_3)) \stackrel{(E-IF1)}{\mapsto}$ ($\,\text{erase}(M)$, $\text{erase}(e_2)$). If $b = false$ then $(\,\text{erase}(M), \text{if}\, \text{erase}(e_1)\, \text{then}\, \text{erase}(e_2)\, \text{else}\, \text{erase}(e_3)) \stackrel{(E-IF2)}{\mapsto}$ ($\,\text{erase}(M)$, $\text{erase}(e_3)$). If e_1 is not in the set c, then $\text{erase}(e_1)$ is not a value and $\text{erase}((M,e_1)) \mapsto (L',d')$ by induction. Therefore $(\,\text{erase}(M), \text{if}\, \text{erase}(e_1)\, \text{then}\, \text{erase}(e_2)\, \text{else}\, \text{erase}(e_3)) \stackrel{(congruence\, rule) E[e]=\text{if}\, e\, \text{then}\, e_2\, \text{else}\, e_3}{\mapsto}$ $(L', \text{if}\, d'\, \text{then}\, \text{erase}(e_2)\, \text{else}\, \text{erase}(e_3))$.

8. Case: $e = \text{fix}\, x : \tau :\stackrel{\phi}{i}$ .v where $i > 0$. By (ER-FIX) $\text{erase}(e) = \text{fix}\, x.\, \text{erase}(v)$. $\text{fix}\, x.\, \text{erase}(v) \stackrel{(U-FIX)}{\mapsto} [x \mapsto \text{fix}\, x.\, \text{erase}(v)]\, \text{erase}(v)$.

9. Case: $e = \text{let}\, \langle \overrightarrow{x} \rangle = e_1 \,\text{in}\, e_2$. By (ER-LET) $\text{erase}((M,e)) = (\,\text{erase}(M), \text{let}\, \langle \overrightarrow{x} \rangle = \text{erase}(e_1)\, \text{in}\, \text{erase}(e_2)$. If e_1 is in the set c, by (C-*Step-Value) $(M,e_1) \stackrel{*}{\mapsto} (M,v_1)$. Since e is well-typed, $e_1 : \langle \overrightarrow{t} \rangle$ and we know $\overrightarrow{x:\tau}$ by (T-LET). By Canonical Forms, $v_1 = \langle \overrightarrow{v} \rangle$and $\overrightarrow{x:\tau}$ means v_1 has the same number of elements as $\langle \overrightarrow{x} \rangle$. $\text{erase}(v_1) = \langle \overrightarrow{\text{erase}(v)} \rangle$ and $(\,\text{erase}(M), \text{let}\, \langle \overrightarrow{x} \rangle = \langle \overrightarrow{\text{erase}(v)} \rangle\, \text{in}\, \text{erase}(e_2) \stackrel{(E-LET)}{\mapsto} [\langle \overrightarrow{x} \rangle \mapsto \langle \overrightarrow{\text{erase}(v)} \rangle]\, \text{erase}(e_2)$.

8.5 THEOREM [ERASURE-PROGRESS-3]

$$\frac{C \vdash (M, e:\tau) \,\text{where}\, C \,\text{has an empty}\, \Delta \,\text{and}\, \Gamma \quad \text{erase}((M,e)) \mapsto (L',d')}{(M,e) \stackrel{+}{\mapsto} (M',e'),\ \text{erase}((M',e')) = (L',d')}$$

If $\text{erase}(e)$ is not a value then, by Untyped-Non-Values-Step, $\text{erase}((M,e))$ evaluates to (L',d'). Additionally, (M,e) evaluates in one or more steps to (M',e'), and $\text{erase}((M',e'))= (L',d')$. Proof by induction on the expression rules. There are several cases for this proof. For each, we list the rules which follow the case and show one proof. The other proofs in each case can be obtained using a similar proof to the example.

8.5.1 Case: The values:

$$e = i \mid b \mid \Lambda\alpha : K; B.v \mid \text{pack}[\tau_1, v] \,\text{as}\, \exists\alpha : K; B.\tau_2 \mid \lambda x : \tau \stackrel{\phi, limit}{\longrightarrow} e_1$$
$$\mid \text{roll}[(\mu\alpha : K.\tau_0)\tau_1 \ldots \tau_n](v) \mid \phi\langle \overrightarrow{v} \rangle \mid \text{union}(b, \tau_1, \tau_2, v) \mid \text{fact}$$

By Value-Erase-Value, $\text{erase}(v) = u$ and Erasure-Progress-3 does not apply.

8.5.2 Case: Most of the non values:

$$e = e_1\, \tau \mid \neg e_1 \mid \text{union}(b, \tau_1, \tau_2, e_1) \mid \text{pack}[\tau_1, e_1] \,\text{as}\, \exists\alpha : K; B.\tau_2$$
$$\mid \text{case}(b, e_1) \mid \text{roll}[(\mu\alpha : K.\tau_0)\tau_1 \cdots \tau_n](e_1) \mid \text{unroll}(e_1)$$

The proofs for all of these use the same format with the Congruence rule and induction steps that apply to each. Let $e = e_1\, \tau$.
$\text{erase}(e) = \text{erase}(e_1\, \tau) = \text{erase}(e_1)$ by (ER-APPT).

- If $\text{erase}(e_1)$ is a value, then $\text{erase}(e)$ is a value and Erasure-Progress-3 does not apply.
- If $\text{erase}(e_1)$ is a non value, then $\text{erase}(e)$ is a non value. $\text{erase}((M,e_1)) \mapsto (L',d_1')$ by Untyped-Non-Values-Step and $(M,e_1) \stackrel{+}{\mapsto} (M',e_1')$, $\text{erase}((M',e_1')) = (L',d_1')$ by induction. $(M,e) = (M, e_1\, \tau) \stackrel{+, (congruence\, rule) E[e]=e\, \tau}{\mapsto}$ $(M', e_1'\, \tau) = (M',e')$ so $(M,e) \stackrel{+}{\mapsto} (M',e')$. $\text{erase}((M,e)) = (\,\text{erase}(M), \text{erase}(e))= (\,\text{erase}(M), \text{erase}(e_1)) \mapsto (L',d_1') = (L',d')$ so $\text{erase}((M,e)) \mapsto (L',d')$. $\text{erase}((M',e')) = (\,\text{erase}(M'), \text{erase}(e')) = (\,\text{erase}(M'), \text{erase}(e_1'\, \tau)) = (\,\text{erase}(M'), \text{erase}(e_1'))= (L',d_1') = (L',d')$ by (ER-M) and (ER-APPT) so $\text{erase}((M',e')) = (L',d')$.

8.5.3 Case: Let $e = \mathbf{unpack}\,\alpha, x = e_1\,\mathbf{in}\,e_2$.

$\mathrm{erase}(e) = \mathrm{erase}(\mathrm{unpack}\,\alpha, x = e_1\,\mathrm{in}\,e_2) = \mathrm{let}\,x = \mathrm{erase}(e_1)\,\mathrm{in}\,\mathrm{erase}(e_2)$by (ER-UNPACK).

- Let $\mathrm{erase}(e_1)$ be a value.
  $(M, e_1) \overset{*}{\mapsto} (M, v_1)$, and$\mathrm{erase}((M, e_1)) = \mathrm{erase}((M, v_1))$ by Erasure-Progress-2. $(M, e) = (M, \mathrm{unpack}\,\alpha, x = e_1\,\mathrm{in}\,e_2)$
  $\overset{*,(congruence\,rule)E[e]=\mathrm{unpack}\,\alpha,x=e\,\mathrm{in}\,e_2}{\mapsto} (M, \mathrm{unpack}\,\alpha, x = v_1\,\mathrm{in}\,e_2)$. - Let v_1 be false.
  $(M, e) = (M, \text{if } e_1 \text{ then } e_2 \text{ else } e_3) \overset{*,(congruence\ rule) E[e]=\text{if } e \text{ then } e_2 \text{ else } e_3}{\mapsto} (M, \text{if } v_1 \text{ then } e_2 \text{ else } e_3)$ and
  $(M, \text{if } v_1 \text{ then } e_2 \text{ else } e_3) \overset{(E-IF2)}{\mapsto} (M, e_3) = (M', e')$. $\text{erase}(v_1) = \text{erase}(\text{false}) = \text{false}$ so $\text{erase}(e_1)$ is false. $\text{erase}((M, e)) = (\text{erase}(M), \text{if erase}(e_1) \text{ then erase}(e_2) \text{ else erase}(e_3)) \overset{(E-IF2)}{\mapsto} (\text{erase}(M), \text{erase}(e_3)) = (L', d')$. $\text{erase}((M', e'))= (\text{erase}(M), \text{erase}(e_3)) = (L', d')$.

- Let $\text{erase}(e_1)$ be a non value.
  $\text{erase}((M, e_1)) \mapsto (M', d_1)$ by Untyped-Non-Values-Step and $(M, e_1) \overset{+}{\mapsto} (M', e_1')$, $\text{erase}((M', e_1')) = (L', d_1)$ by induction. $(M, e) = (M, \text{if } e_1 \text{ then } e_2 \text{ else } e_3) \overset{+,(congruence\ rule) E[e]=\text{if } e \text{ then } e_2 \text{ else } e_3}{\mapsto} (M', \text{if } e_1' \text{ then } e_2 \text{ else } e_3) = (M', e')$. $\text{erase}((M, e)) = (\text{erase}(M), \text{if erase}(e_1) \text{ then erase}(e_2) \text{ else erase}(e_3)) \overset{(congruence\ rule) E[e]=\text{if } e \text{ then } e_2 \text{ else } e_3}{\mapsto} (L', \text{if } d_1 \text{ then erase}(e_2) \text{ else erase}(e_3)) = (L', d')$. $\text{erase}((M', e')) = (\text{erase}(M'), \text{erase}(\text{if } e_1' \text{ then } e_2 \text{ else } e_3))= (\text{erase}(M'), \text{if erase}(e_1') \text{ then erase}(e_2) \text{ else erase}(e_3))$ by (ER-M) and (ER-IF). This equals $(L', \text{if } d_1 \text{ then erase}(e_2) \text{ else erase}(e_3)) = (L', d')$.

8.5.9 Case: Let $e = \textbf{if } B \textbf{ then } e_1 \textbf{ else } e_2$.

This expression only occurs inside type coersion functions so $\text{if } B \text{ then } e_1 \text{ else } e_2$ will be removed by an erase() of a higher expression and $\text{erase}(\text{if } B \text{ then } e_1 \text{ else } e_2)$ is undefined.

8.5.10 Case: Let $e = \textbf{fix } x : t :\overset{\phi}{i} .v$.

- Let $i > 0$
  $\text{erase}(e) = \text{erase}(\text{fix } x : t :\overset{\phi}{i} .v) = \text{fix } x. \text{erase}(v)$ by (ER-FIX). $e = \text{fix } x : t :\overset{\phi}{i} .v \overset{(E-FIX)}{\mapsto} [x \mapsto \text{fix } x : t :\overset{\phi}{i} .v]v = e'$. $\text{erase}(e) = \text{fix } x. \text{erase}(v) \overset{(U-FIX)}{\mapsto} [x \mapsto \text{fix } x. \text{erase}(v)] \text{erase}(v) = d'$. $\text{erase}(e') = \text{erase}([x \mapsto \text{fix } x : t :\overset{\phi}{i} .v]v) = [x \mapsto \text{erase}(\text{fix } x : t :\overset{\phi}{i} .v)] \text{erase}(v) = d'$ by Erase-Term-Substitution. This equals $[x \mapsto \text{fix } x. \text{erase}(v)]v = d'$.

- Let $i = 0$
  $\text{erase}(e) = \text{erase}(\text{fix } x : t :\overset{\phi}{0} .v) = \langle\rangle$ by (ER-FIX0). This is a value so Erasure-Progress-3 does not apply.

8.5.11 Case: Let $(M, e) = (M, \textbf{load}(e_{ptr}, e_{Has})) \mid (M, \textbf{store}(e_{ptr}, e_{Has}, e_v))$

The proofs for these cases are similar. We will only show one of the proofs.

Let $(M, e) = (M, \text{load}(e_{ptr}, e_{Has}))$.
$\text{erase}((M, e)) = \text{erase}((M, \text{load}(e_{ptr}, e_{Has})))= (\text{erase}(M), \text{erase}(\text{load}(e_{ptr}, e_{Has})))$
$= (\text{erase}(M), \text{load}(\text{erase}(e_{ptr}), \text{erase}(e_{Has})))$ by (ER-M) and (ER-LOAD).

- Let $\text{erase}(e_{ptr})$ and $\text{erase}(e_{Has})$ be values.
  $(M, e_{ptr}) \overset{*}{\mapsto} (M, v_{ptr})$ and $\text{erase}((M, e_{ptr})) = \text{erase}((M, v_{ptr}))$ by Erasure-Progress-2. $(M, e_{Has}) \overset{*}{\mapsto} (M, v_{Has})$ and $\text{erase}((M, e_{Has})) = \text{erase}((M, v_{Has}))$ also by Erasure-Progress-2. By canonical forms, $v_{ptr} = i$ and $v_{Has} = \text{fact}$. $\text{erase}((M, e)) = (\text{erase}(M), \text{load}(\text{erase}(e_{ptr}), \text{erase}(e_{Has}))) \overset{(U-LOAD)}{\mapsto} (\text{erase}(M), \langle M(i), \langle\rangle\rangle) = (L', d')$.$(M, e) = (M, \text{load}(e_{ptr}, e_{Has}))$
  $\overset{*,(congruence\ rule) E[e]=\text{load}(e, e_{Has})}{\mapsto} (M, \text{load}(i, e_{Has}))$ and $(M, \text{load}(i, e_{Has})) \overset{*,(congruence\ rule) E[e]=\text{load}(v_{ptr}, e)}{\mapsto}$
  $(M, \text{load}(i, \text{fact}))$ and $(M, \text{load}(i, \text{fact})) \overset{(E-LOAD)}{\mapsto} (M, \wedge\langle M(i), \text{fact}\rangle) = (M, e')$. $\text{erase}((M, e'))$
  $= \text{erase}((M, \wedge\langle M(i), \text{fact}\rangle))= (\text{erase}(M), \langle M(i), \langle\rangle\rangle)= (L, d')$ by (ER-M), (ER-M2), (ER-i), and (ER-FACT).

- Let $\text{erase}(e_{ptr})$ be a value and $\text{erase}(e_{Has})$ be a non value.
  $(M, e_{ptr}) \overset{*}{\mapsto} (M, v_{ptr})$ and $\text{erase}((M, e_{ptr})) = \text{erase}((M, v_{ptr}))$ by Erasure-Progress-2. By canonical forms, $v_{ptr} = i$. $\text{erase}((M, e_{Has})) \mapsto (L_2', d_{Has})$ by Untyped-Non-Values-Step and
  $(M, e_{Has}) \overset{+}{\mapsto} (M_2', e_{Has}')$, $\text{erase}((M_2', e_{Has}')) = (L_2', d_{Has})$ by induction.
  $\text{erase}((M, e)) = (\text{erase}(M), \text{load}(\text{erase}(e_{ptr}), \text{erase}(e_{Has}))) \overset{(congruence\ rule) E[e]=\text{load}(v_{ptr}, e)}{\mapsto}$
  $(L_2', \text{load}(\text{erase}(e_{ptr}), d_{Has})) = (L_2', \text{load}(i, d_{Has})) = (L', d')$. $(L_2' = L')$. $(M, e) = (M, \text{load}(e_{ptr}, e_{Has}))$
  $\overset{*, (congruence\ rule) E[e]=\text{load}(e, e_{Has})}{\mapsto} (M, \text{load}(i, e_{Has}))$ and $(M, \text{load}(i, e_{Has})) \overset{+, (congruence\ rule) E[e]=\text{load}(v_{ptr}, e)}{\mapsto}$
  $(M_2', \text{load}(i, e_{Has}')) = (M', e')$. $(M_2' = M')$.
  $\text{erase}((M', e')) = \text{erase}((M_2', \text{load}(i, e_{Has}'))) = (\text{erase}(M_2'), \text{load}(i, \text{erase}(e_{Has}'))$ by (ER-M), (ER-LOAD), and (ER-i). This equals $(L_2', \text{load}(i, d_{Has}) = (L', d')$.

- Let $\text{erase}(e_{ptr})$ be a non value.
  $\text{erase}((M, e_{ptr})) \mapsto (L, d_{ptr})$ by Untyped-Non-Values-Step and $(M, e_{ptr}) \overset{+}{\mapsto} (M', e_{ptr}')$, $\text{erase}((M', e_{ptr}')) = (L', d_{ptr})$ by induction. $e_{ptr}' = i$ so $\text{erase}(e_{ptr}') = \text{erase}(i) = i = d_{ptr}$. $\text{erase}((M, e)) =$
  $(\text{erase}(M), \text{load}(\text{erase}(e_{ptr}), \text{erase}(e_{Has}))) \overset{(congruence\ rule) E[e]=\text{load}(e, e_{Has})}{\mapsto} (L', \text{load}(d_{ptr}, \text{erase}(e_{Has}))) = (L', d')$.
  $(M, e) = (M, \text{load}(e_{ptr}, e_{Has}))$
  $\overset{+, (congruence\ rule) E[e]=\text{load}(e, e_{Has})}{\mapsto} (M', \text{load}(i, e_{Has})) = (M', e')$. $\text{erase}((M', e')) = \text{erase}((M', \text{load}(i, e_{Has}))) =$
  $(\text{erase}(M'), \text{load}(i, \text{erase}(e_{Has})))$ by (ER-M), (ER-LOAD), and (ER-i). This equals $(L', \text{load}(d_{ptr}, \text{erase}(e_{Has}))) = (L', d')$.

8.5.12 Case: Let $e = \textbf{coerce}(e) \mid \textbf{make\_eq}(\tau) \mid \textbf{new\_fun}(K)$.

All of these erase to values. These proofs are similar therefore we will only show one.
Let $e = \text{make\_eq}(\tau)$.
$\text{erase}(e) = \text{erase}(\text{make\_eq}(\tau)) = \langle\rangle$ by (ER-MAKEEQ). This is a value so Erasure-Progress-3 does not apply.

8.5.13 Case: $e = \textbf{distinguish}(I_1, I_2, e_1, e_2) \mid \textbf{apply\_eq}(\tau, e_1, e_2) \mid \textbf{discard\_fun}(e_1) \mid \textbf{define\_fun}(e_1, \tau) \mid \textbf{in\_domain}(I_1, I_2, e_1, e_2)$.

The proofs for these are all similar. We will show only one of these proofs.
Let $e = \text{discard\_fun}(e_1)$.
$\text{erase}(e) = \text{erase}(\text{discard\_fun}(e_1)) = \text{let}\, x = \text{erase}(e_1)\, \text{in}\, \langle\rangle$ by (ER-DISCARDFUN). By Untyped-Non-Values-Step, $\text{erase}((M, e)) \mapsto (L', d')$.

- Let $\text{erase}(e_1)$ be a value.
  $(M, e_1) \overset{*}{\mapsto} (M, v_1)$ and $\text{erase}((M, e_1)) = \text{erase}((M, v_1))$ by Erasure-Progress-2. By Value-Erase-Value, $\text{erase}(v_1)$ is a value. $\text{erase}((M, e_1)) = \text{erase}((M, \langle\rangle))$. $\text{erase}((M, e)) = (\text{erase}(M), \text{let}\, x = \text{erase}(e_1)\, \text{in}\, \langle\rangle) \overset{(E-LET)}{\mapsto}$
  $(\text{erase}(M), \langle\rangle) = (L', d')$. $(M, e) = (M, \text{discard\_fun}(e_1)) \overset{*, (congruence\ rule) E[e]=\text{discard\_fun}(e)}{\mapsto} (M, \text{discard\_fun}(v_1))$
  $\overset{(E-DISCARDFUN)}{\mapsto} (M, \cdot\langle\rangle) = (M, e')$. $\text{erase}((M, e')) = (\text{erase}(M), \text{erase}(\cdot\langle\rangle))$. $= (\text{erase}(M), \langle\rangle) = (L', d')$ by (ER-M) and (ER-TUPLE) or (ER-TUPLEv0).

- Let $\text{erase}(e_1)$ be a non value.
  $\text{erase}((M, e_1)) \mapsto (L', d_1)$ by Untyped-Non-Values-Step and $(M, e_1) \overset{+}{\mapsto} (M', e_1')$, $\text{erase}((M', e_1')) = (L', d_1)$ by induction. $(M, e) = (M, \text{discard\_fun}(e_1)) \overset{+, (congruence\ rule) E[e]=\text{discard\_fun}(e)}{\mapsto} (M', \text{discard\_fun}(e_1')) = (M', e')$.
  $\text{erase}((M, e)) = (\text{erase}(M), \text{let}\, x = \text{erase}(e_1)\, \text{in}\, \langle\rangle \overset{(congruence\ rule) E[e]=\text{let}\, x=e\, \text{in}\, e_2}{\mapsto} (L', \text{let}\, x = d_1\, \text{in}\, \langle\rangle) = (L', d')$.
  $\text{erase}((M', e')) = (\text{erase}(M'), \text{erase}(\text{discard\_fun}(e_1'))) = (\text{erase}(M'), \text{let}\, x = \text{erase}(e_1')\, \text{in}\, \langle\rangle)$ by (ER-M) and (ER-DISCARDFUN). This equals $(L', \text{let}\, x = d_1\, \text{in}\, \langle\rangle) = (L', d')$.

9 Converting λ^C to λ^{low}

We define a translation from λ^C to λ^{low}, and prove the correctness of the translation. The language λ^C was defined by Morrisett et al[3] as follows:

$\tau = \alpha \mid \text{int} \mid \forall[\overrightarrow{\alpha}].(\overrightarrow{\tau}) \to \text{void} \mid \langle \overrightarrow{\tau} \rangle \mid \exists\alpha.\tau$

$e = v(\overrightarrow{v}) \mid \text{if0}(v,\, e_1,\, e_2) \mid \text{halt}[\tau]v \mid \text{let } x = v \text{ in } e \mid \text{let } x = \pi_i v \text{ in } e$
$\mid \text{let } x = v_1\, p\, v_2 \text{ in } e \mid \text{let } [\alpha, x] = \text{unpack } v \text{ in } e$

$v = x \mid i \mid \langle \overrightarrow{v} \rangle \mid v[\tau] \mid \text{pack}[\tau,\, v] \text{ as } \exists\alpha.\tau'$
$\mid fixcode\, x[\overrightarrow{\alpha}](\overrightarrow{x:\tau}).e$

$p = + \mid - \mid *$

The languages λ^{C_2} to λ^{flat}, defined below, are intermediate languages to assist the ultimate translation from λ^C to λ^{low}.

9.1 Converting λ^C to λ^{C_2}

The language λ^{C_2} extends λ^C with two distinct kinds (pointer and primitive):

$K = \text{ptr} \mid \text{primitive}$

$\tau = \alpha \mid \text{int} \mid \forall[\overrightarrow{\alpha : K}].(\overrightarrow{\tau}) \to \text{void} \mid \langle \overrightarrow{\tau} \rangle \mid \exists\alpha : K.\tau$

$e = v(\overrightarrow{v}) \mid \text{if0}(v,\, e_1,\, e_2) \mid \text{halt}[\tau]v \mid \text{let } x = v \text{ in } e$
$\mid \text{let } x = v_1\, p\, v_2 \text{ in } e \mid \text{let } [\alpha, x] = \text{unpack } v \text{ in } e$

$v = x \mid i \mid \langle \overrightarrow{v} \rangle \mid v[\tau] \mid \text{pack}[\tau,\, v] \text{ as } \exists\alpha : K.\tau' \mid \pi_i v$
$\mid fixcode\, x[\overrightarrow{\alpha : K}](\overrightarrow{x:\tau}).e$

$p = + \mid - \mid *$

To make the λ^C-to-λ^{C_2} translation neater, λ^{C_2} defines $\pi_i v$ to be a v. The later λ^{C_2}-to-λ^{flat} translation removes $\pi_i v$ from v.

Type Checking Rules for λ^{C_2}:

(KD-VAR) $\Delta, \alpha : K \vdash \alpha : K$

(KD-INT) $\Delta \vdash \text{int:primitive}$

(KD-ALL) $$\frac{\Delta,\, \overrightarrow{\alpha : K} \vdash \tau_i : K_i}{\Delta \vdash \forall[\overrightarrow{\alpha : K}].(\overrightarrow{\tau}) \to \text{void} : \text{primitive}}$$

(KD-TUPLE) $$\frac{\Delta \vdash \tau_i : K_i}{\Delta \vdash \langle \overrightarrow{\tau} \rangle : \text{ptr}}$$

(KD-SOME) $$\frac{\Delta,\, \alpha : K \vdash \tau : K'}{\Delta \vdash (\exists\alpha : K.\tau) : K'}$$

(TD-APP) $$\frac{\Delta; \Gamma \vdash v : (\tau_1, \cdots, \tau_n) \to \text{void} \quad \Delta; \Gamma \vdash v_i : \tau_i}{\Delta; \Gamma \vdash v(\overrightarrow{v})}$$

(TD-IF) $$\frac{\Delta; \Gamma \vdash v : \text{int} \quad \Delta; \Gamma \vdash e_1 \quad \Delta; \Gamma \vdash e_2}{\Delta; \Gamma \vdash \text{if0}(v,\, e_1,\, e_2)}$$

(TD-HALT) $\dfrac{\Delta;\Gamma \vdash v : \tau}{\Delta;\Gamma \vdash \mathrm{halt}[\tau] v}$

(TD-SUB) $\dfrac{\Delta;\Gamma \vdash v : \tau \quad \Delta;\Gamma,\, x : \tau \vdash e}{\Delta;\Gamma \vdash \mathrm{let}\, x = v \,\mathrm{in}\, e}\ (x \notin \Gamma)$

(TD-PROJECT) $\dfrac{\Delta;\Gamma \vdash v : \langle \tau_1, \cdots, \tau_n \rangle}{\Delta;\Gamma \vdash \pi_i v : \tau_i}\ (1 \le i \le n)$

(TD-UNPACK) $\dfrac{\Delta;\Gamma \vdash v : \exists \alpha : K.\tau \quad (\Delta, \alpha : K); (\Gamma, x : \tau) \vdash e}{\Delta;\Gamma \vdash \mathrm{let}\, [\alpha, x] = \mathrm{unpack}\, v \,\mathrm{in}\, e}\ (x \notin \Gamma \wedge \alpha \notin \Delta)$

(TD-OP) $\dfrac{\Delta;\Gamma \vdash v_1 : \mathrm{int} \;\; \Delta;\Gamma \vdash v_2 : \mathrm{int} \;\; \Delta;\Gamma,\, x : \mathrm{int} \vdash e}{\Delta;\Gamma \vdash \mathrm{let}\, x = v_1\, p\, v_2 \,\mathrm{in}\, e}\ (x \notin \Gamma)$

(TD-VAR) $\Delta;\Gamma, x : \tau \vdash x : \tau$

(TD-INT) $\Delta;\Gamma \vdash i : \mathrm{int}$

(TD-TAPP) $\dfrac{\Delta \vdash \tau_0 : K \quad \Delta;\Gamma \vdash v : \forall[\alpha : K, \overrightarrow{\beta : K'}].(\overrightarrow{\tau}) \to \mathrm{void}}{\Delta;\Gamma \vdash v[\tau_0] : (\forall[\overrightarrow{\beta : K'}].(\overrightarrow{\tau}[\tau_0/\alpha]) \to \mathrm{void})}$

(TD-TUPLE) $\dfrac{\Delta;\Gamma \vdash v_i : \tau_i}{\Delta;\Gamma \vdash \langle \overrightarrow{v} \rangle : \langle \overrightarrow{\tau} \rangle}\ (x_0 \notin \Gamma)$

(TD-PACK) $\dfrac{\Delta \vdash \tau : K \quad \Delta;\Gamma \vdash v : \tau'[\tau/\alpha]}{\Delta;\Gamma \vdash \mathrm{pack}[\tau,\, v] \,\mathrm{as}\, \exists \alpha : K.\tau' :\ \exists \alpha : K.\tau'}$

(TD-FIX) $\dfrac{\overrightarrow{\alpha : K} \vdash \tau_i : K_i' \quad \overrightarrow{\alpha : K};\, x : \forall[\overrightarrow{\alpha : K}].(\overrightarrow{\tau}) \to \mathrm{void},\, x_1 : \tau_1, \cdots, x_n : \tau_n \vdash e}{\Delta;\Gamma \vdash\ fixcode\, x[\overrightarrow{\alpha : K}](\overrightarrow{x : \tau}).e\ \ : \forall[\overrightarrow{\alpha : K}].(\overrightarrow{\tau}) \to \mathrm{void}}$

(TD-ENV) $\dfrac{\Delta \vdash \tau_i : K_i}{\Delta \vdash\ \{x_1 \mapsto \tau_1, \ldots, x_n \mapsto \tau_n\}}$

The translation from λ^C to λ^{C_2} boxes all non-pointer types:

$\mathcal{B}(\{\alpha_1, \ldots, \alpha_n\}) = \{\alpha_1 \mapsto \mathrm{ptr}, \ldots, \alpha_n \mapsto \mathrm{ptr}\}$

$\mathcal{B}(\{x_1 \mapsto \tau_1, \ldots, x_n \mapsto \tau_n\}) = \{x_1 \mapsto \mathcal{B}(\tau_1), \ldots, x_n \mapsto \mathcal{B}(\tau_n)\}$

$\mathcal{B}(\alpha) = \alpha$

$\mathcal{B}(\mathrm{int}) = \langle \mathrm{int} \rangle$

$\mathcal{B}(\forall \overrightarrow{\alpha}.\overrightarrow{\tau} \to \mathrm{void}) = \langle \forall \overrightarrow{\alpha : \mathrm{ptr}}.\overrightarrow{B(\tau)} \to \mathrm{void} \rangle$

$\mathcal{B}(\langle \overrightarrow{\tau} \rangle) = \langle \overrightarrow{B(\tau)} \rangle$

$\mathcal{B}(\exists \alpha.\tau') = \exists \alpha : \mathrm{ptr}.\mathcal{B}(\tau')$

$\mathcal{B}(v(\overrightarrow{v})) = (\pi_1(\mathcal{B}(v)))(\overrightarrow{\mathcal{B}(v)})$

$\mathcal{B}(\mathrm{if0}(v, e_1, e_2)) = \mathrm{if0}(\pi_1(\mathcal{B}(v)), \mathcal{B}(e_1), \mathcal{B}(e_2))$

$\mathcal{B}(\mathrm{halt}[\tau]v) = \mathrm{halt}[\mathcal{B}(\tau)]\mathcal{B}(v)$

$\mathcal{B}(\mathrm{let}\, x = v \,\mathrm{in}\, e) = \mathrm{let}\, x = \mathcal{B}(v) \,\mathrm{in}\, \mathcal{B}(e)$

$\mathcal{B}(\text{let } x = \pi_i(v) \text{ in } e) = \text{let } x = \pi_i(\mathcal{B}(v)) \text{ in } \mathcal{B}(e)$

$\mathcal{B}(\text{let } x = v_1\, p\, v_2 \text{ in } e) = \text{let } x = \langle(\pi_1(\mathcal{B}(v_1)))\, p\, (\pi_1(\mathcal{B}(v_2)))\rangle \text{ in } \mathcal{B}(e)$

$\mathcal{B}(\text{let } [\alpha, x] = \text{unpack } v \text{ in } e) = \text{let } [\alpha, x] = \text{unpack } \mathcal{B}(v) \text{ in } \mathcal{B}(e)$

$\mathcal{B}(x) = x$

$\mathcal{B}(i) = \langle i \rangle$

$\mathcal{B}(\langle \overrightarrow{v} \rangle) = \langle \overrightarrow{\mathcal{B}(v)} \rangle$

$\mathcal{B}(v[\tau]) = \langle(\pi_1(\mathcal{B}(v)))[\mathcal{B}(\tau)]\rangle$

$\mathcal{B}(\text{pack}[\tau,\, v] \text{ as } \exists\alpha : K.\tau') = \text{pack}[\mathcal{B}(\tau),\, \mathcal{B}(v)] \text{ as } \exists\alpha : \text{ptr}.\mathcal{B}(\tau')$

$\mathcal{B}(fixcode\, x[\overrightarrow{\alpha}](\overrightarrow{x:\tau}).e) = \langle fixcode\, x_0[\overrightarrow{\alpha : \text{ptr}}](\overrightarrow{x : \mathcal{B}(\tau)}).\text{let } x = \langle x_0 \rangle \text{ in } \mathcal{B}(e)\rangle$

Lemma1: If $\mathcal{B}(\Delta); \mathcal{B}(\Gamma) \vdash_{C_2} e : \mathcal{B}(\tau[\tau'/\alpha])$, then $\mathcal{B}(\Delta); \mathcal{B}(\Gamma) \vdash_{C_2} e : \mathcal{B}(\tau)[\mathcal{B}(\tau')/\alpha]$

Proof :

1*a*. $\tau = \alpha$
$\mathcal{B}(\tau[\tau'/\alpha]) = \mathcal{B}(\tau')$
$\mathcal{B}(\tau)[\mathcal{B}(\tau')/\alpha] = \mathcal{B}(\alpha)[\mathcal{B}(\tau')/\alpha] = \alpha[\mathcal{B}(\tau')/\alpha] = \mathcal{B}(\tau')$
Thus, $\mathcal{B}(\tau[\tau'/\alpha]) = \mathcal{B}(\tau)[\mathcal{B}(\tau')/\alpha]$.

1*b*. $\tau = \beta \neq \alpha$
$\mathcal{B}(\tau[\tau'/\alpha]) = \mathcal{B}(\beta) = \beta$
$\mathcal{B}(\tau)[\mathcal{B}(\tau')/\alpha] = \mathcal{B}(\beta)[\mathcal{B}(\tau')/\alpha] = \beta[\mathcal{B}(\tau')/\alpha] = \beta$
Thus, $\mathcal{B}(\tau[\tau'/\alpha]) = \mathcal{B}(\tau)[\mathcal{B}(\tau')/\alpha]$.

2. $\tau = \text{int}$
$\mathcal{B}(\tau[\tau'/\alpha]) = \mathcal{B}(\text{int}[\tau'/\alpha]) = \mathcal{B}(\text{int}) = \langle \text{int} \rangle$
$\mathcal{B}(\tau)[\mathcal{B}(\tau')/\alpha] = \mathcal{B}(\text{int})[\mathcal{B}(\tau')/\alpha] = \langle \text{int} \rangle[\mathcal{B}(\tau')/\alpha] = \langle \text{int} \rangle$
Thus, $\mathcal{B}(\tau[\tau'/\alpha]) = \mathcal{B}(\tau)[\mathcal{B}(\tau')/\alpha]$.

3. $\tau = \forall[\overrightarrow{\beta}].(\overrightarrow{\tau}) \to \text{void}$
$\mathcal{B}(\tau[\tau'/\alpha]) = \mathcal{B}((\forall[\overrightarrow{\beta}].(\overrightarrow{\tau}) \to \text{void})[\tau'/\alpha]) = \mathcal{B}(\forall[\overrightarrow{\beta}].(\overrightarrow{\tau[\tau'/\alpha]}) \to \text{void})$
$= \langle \forall\overrightarrow{\alpha : \text{ptr}}.\overrightarrow{\mathcal{B}(\tau[\tau'/\alpha])} \to \text{void} \rangle$

$\mathcal{B}(\tau)[\mathcal{B}(\tau')/\alpha] = \mathcal{B}(\forall[\overrightarrow{\beta}].(\overrightarrow{\tau}) \to \text{void})[\mathcal{B}(\tau')/\alpha] = \langle \forall\overrightarrow{\alpha : \text{ptr}}.\overrightarrow{B(\tau)} \to \text{void} \rangle[\mathcal{B}(\tau')/\alpha]$
$= \langle \forall\overrightarrow{\alpha : \text{ptr}}.\overrightarrow{B(\tau)[\mathcal{B}(\tau')/\alpha]} \to \text{void} \rangle$
By induction, we know $\mathcal{B}(\tau)[\mathcal{B}(\tau')/\alpha] = \langle \forall\overrightarrow{\alpha : \text{ptr}}.\overrightarrow{\mathcal{B}(\tau[\tau'/\alpha])} \to \text{void} \rangle$
Thus, $\mathcal{B}(\tau[\tau'/\alpha]) = \mathcal{B}(\tau)[\mathcal{B}(\tau')/\alpha]$.

4. $\tau = \langle \overrightarrow{\tau} \rangle$
$\mathcal{B}(\tau[\tau'/\alpha]) = \mathcal{B}(\langle \overrightarrow{\tau} \rangle[\tau'/\alpha]) = \mathcal{B}(\langle \overrightarrow{\tau[\tau'/\alpha]} \rangle) = \langle \overrightarrow{\mathcal{B}(\tau[\tau'/\alpha])} \rangle$
$\mathcal{B}(\tau)[\mathcal{B}(\tau')/\alpha] = \mathcal{B}(\langle \overrightarrow{\tau} \rangle)[\mathcal{B}(\tau')/\alpha] = \langle \overrightarrow{B(\tau)} \rangle[\mathcal{B}(\tau')/\alpha] = \langle \overrightarrow{B(\tau)[\mathcal{B}(\tau')/\alpha]} \rangle$
By induction, we can get $\mathcal{B}(\tau)[\mathcal{B}(\tau')/\alpha] = \langle \overrightarrow{\mathcal{B}(\tau[\tau'/\alpha])} \rangle$

Thus, $\mathcal{B}(\tau[\tau'/\alpha]) = \mathcal{B}(\tau)[\mathcal{B}(\tau')/\alpha]$.

5. $\tau = \exists\beta.\tau_0$
$\mathcal{B}(\tau[\tau'/\alpha]) = \mathcal{B}((\exists\beta.\tau_0)[\tau'/\alpha]) = \mathcal{B}(\exists\beta : \text{ptr}.(\tau_0[\tau'/\alpha])) = \exists\beta : \text{ptr}.\mathcal{B}((\tau_0[\tau'/\alpha]))$
$\mathcal{B}(\tau)[\mathcal{B}(\tau')/\alpha] = \mathcal{B}(\exists\beta.\tau_0)[\mathcal{B}(\tau')/\alpha] = \exists\beta : \text{ptr}.\mathcal{B}(\tau_0)[\mathcal{B}(\tau')/\alpha] = \exists\beta : \text{ptr}.(\mathcal{B}(\tau_0)[\mathcal{B}(\tau')/\alpha])$
By induction, we obtain $\mathcal{B}(\tau)[\mathcal{B}(\tau')/\alpha] = \exists\beta : \text{ptr}.(\mathcal{B}(\tau_0)[\mathcal{B}(\tau')/\alpha]) = \exists\beta : \text{ptr}.\mathcal{B}((\tau_0[\tau'/\alpha]))$
Thus, $\mathcal{B}(\tau[\tau'/\alpha]) = \mathcal{B}(\tau)[\mathcal{B}(\tau')/\alpha]$.

Correctness :

1. If $\Delta \vdash_C \tau$, then $\mathcal{B}(\Delta) \vdash_{C_2} \mathcal{B}(\tau) : \text{ptr}$
2. If $\Delta \vdash_C \Gamma$, then $\mathcal{B}(\Delta) \vdash_{C_2} \mathcal{B}(\Gamma)$
3. If $\Delta; \Gamma \vdash_C e$, then $\mathcal{B}(\Delta); \mathcal{B}(\Gamma) \vdash_{C_2} \mathcal{B}(e)$
4. If $\Delta; \Gamma \vdash_C v : \tau$, then $\mathcal{B}(\Delta); \mathcal{B}(\Gamma) \vdash_{C_2} \mathcal{B}(v) : \mathcal{B}(\tau)$

Proof :

The proof of $\mathcal{B}(\Delta) \vdash_{C_2} \mathcal{B}(\Gamma)$ comes directly from $\mathcal{B}(\Delta) \vdash_{C_2} \mathcal{B}(\tau) : \text{ptr}$. The other proofs are by structural induction on the typing and kinding derivations:

1. $\tau = \alpha$, $\mathcal{B}(\tau) = \alpha$
Because $\Delta \vdash_C \tau \quad (FTV(\tau) \subseteq \Delta)$,
$\mathcal{B}(\Delta) = \Delta', \alpha : \text{ptr}$
By the (KD-VAR) rule, we know $\Delta', \alpha : \text{ptr} \vdash_{C_2} \alpha : \text{ptr}$
Thus, $\mathcal{B}(\Delta) \vdash_{C_2} \mathcal{B}(\tau) : \text{ptr}$

2. $\tau = \text{int}$, $\mathcal{B}(\tau) = \langle \text{int} \rangle$
From (KC-INT), $\Delta \vdash_C \text{int}$
By (KD-INT), $\mathcal{B}(\Delta) \vdash_{C_2} \text{int} : \text{primitive}$
By the (KD-TUPLE), we know $\mathcal{B}(\Delta) \vdash_{C_2} \langle \text{int} \rangle : \text{ptr}$
Thus, $\mathcal{B}(\Delta) \vdash_{C_2} \mathcal{B}(\tau) : \text{ptr}$

3. $\tau = \forall\overrightarrow{\alpha}.\overrightarrow{\tau} \to \text{void}$, $B(\tau) = \langle \overrightarrow{\forall\alpha : \text{ptr}.B(\tau)} \to \text{void} \rangle$
$\Delta \vdash_C \forall\overrightarrow{\alpha}.\overrightarrow{\tau} \to \text{void}$ where $\Delta, \overrightarrow{\alpha} \vdash_C \tau_i$.
By induction, $\mathcal{B}(\Delta, \overrightarrow{\alpha}) \vdash_C \mathcal{B}(\tau_i) : \text{ptr}$.
By (KD-ALL), $\mathcal{B}(\Delta) \vdash_C (\overrightarrow{\forall\alpha : \text{ptr}.B(\tau)} \to \text{void}) : \text{primitive}$
By the (KD-TUPLE) rule, we know $B(\Delta) \vdash_{C_2} \langle \overrightarrow{\forall\alpha : \text{ptr}.B(\tau)} \to \text{void} \rangle : \text{ptr}$
Thus, $B(\Delta) \vdash_{C_2} B(\tau) : \text{ptr}$

4. $\tau_0 = \langle \overrightarrow{\tau} \rangle$, $B(\tau_0) = \langle \overrightarrow{B(\tau)} \rangle$
$\Delta \vdash_C \langle \overrightarrow{\tau} \rangle$, and $\Delta \vdash_C \tau_i$
By induction, $B(\Delta) \vdash_{C_2} B(\tau_i) : K_i$
From the (KD-TUPLE) rule, we know $B(\Delta) \vdash_{C_2} \langle \overrightarrow{B(\tau)} \rangle : \text{ptr}$
Thus, $B(\Delta) \vdash_{C_2} B(\tau_0) : \text{ptr}$

5. $\tau = \exists\alpha.\tau'$, $\mathcal{B}(\tau) = \exists\alpha : \text{ptr}.\mathcal{B}(\tau')$
Because $\Delta \vdash_C \exists\alpha.\tau'$, then $\Delta, \alpha \vdash_C \tau'$
By induction, we know $\mathcal{B}(\Delta), \alpha : \text{ptr} \vdash_{C_2} \mathcal{B}(\tau') : \text{ptr}$
By the (KD-SOME), $\Delta \vdash_{C_2} \exists\alpha : \text{ptr}.\mathcal{B}(\tau') : \text{ptr}$

6. $e = v(\overrightarrow{v})$, $\mathcal{B}(e) = (\pi_1(\mathcal{B}(v)))(\overrightarrow{\mathcal{B}(v)})$
By the (TC-APP), $\Delta; \Gamma \vdash_C v : (\tau_1, \cdots, \tau_n) \to \text{void}$ and $\Delta; \Gamma \vdash_C v_i : \tau_i$
By induction, $\mathcal{B}(\Delta); \mathcal{B}(\Gamma) \vdash_{C_2} \mathcal{B}(v) : \langle \overrightarrow{\mathcal{B}(\tau)} \to \text{void} \rangle$
and $\mathcal{B}(\Delta); \mathcal{B}(\Gamma) \vdash_{C_2} \mathcal{B}(v_i) : \mathcal{B}(\tau_i)$
By (TD-PROJECT), $\mathcal{B}(\Delta); \mathcal{B}(\Gamma) \vdash_{C_2} \pi_1(\mathcal{B}(v)) : \overrightarrow{\mathcal{B}(\tau)} \to \text{void}$,
By (TD-APP), $\mathcal{B}(\Delta); \mathcal{B}(\Gamma) \vdash_{C_2} (\pi_1(\mathcal{B}(v)))(\overrightarrow{\mathcal{B}(v)})$

7. $e = \text{if0}(v, e_1, e_2)$, $\mathcal{B}(e) = \text{if0}(\pi_1(\mathcal{B}(v)), \mathcal{B}(e_1), \mathcal{B}(e_2))$
By the (TC-IF), $\Delta; \Gamma \vdash_C v : \text{int}$ and $\Delta; \Gamma \vdash_C e_1$, $\Delta; \Gamma \vdash_C e_2$
By induction,$\mathcal{B}(\Delta); \mathcal{B}(\Gamma) \vdash_{C_2} \mathcal{B}(v) : \langle \text{int} \rangle$,
and $\mathcal{B}(\Delta); \mathcal{B}(\Gamma) \vdash_{C_2} \mathcal{B}(e_1)$, $\mathcal{B}(\Delta); \mathcal{B}(\Gamma) \vdash_{C_2} \mathcal{B}(e_2)$
By (TD-PROJECT), $\Delta; \Gamma \vdash_{C_2} \pi_1(\mathcal{B}(v)) : \text{int}$
By (TD-IF), $\mathcal{B}(\Delta); \mathcal{B}(\Gamma) \vdash_{C_2} \text{if0}(\pi_1(\mathcal{B}(v)), \mathcal{B}(e_1), \mathcal{B}(e_2))$

8. $e = \text{halt}[\tau]v$, $\mathcal{B}(\text{e}) = \text{halt}[\mathcal{B}(\tau)]\mathcal{B}(v)$
By (TC-HALT), $\Delta; \Gamma \vdash_C v : \tau$
By induction,$\mathcal{B}(\Delta); \mathcal{B}(\Gamma) \vdash_{C_2} \mathcal{B}(v) : \mathcal{B}(\tau)$,
By (TD-HALT), $\mathcal{B}(\Delta); \mathcal{B}(\Gamma) \vdash_{C_2} \text{halt}[\mathcal{B}(\tau)]\mathcal{B}(v)$

9. $e_0 = \text{let}\, x = v \,\text{in}\, e$, $\mathcal{B}(e_0) = \text{let}\, x = \mathcal{B}(v) \,\text{in}\, \mathcal{B}(e)$
By the (TC-SUB), $\Delta; \Gamma \vdash_C v : \tau$ and $\Delta; \Gamma;\, x : \tau \vdash_C e$
By induction, $\mathcal{B}(\Delta); \mathcal{B}(\Gamma) \vdash_{C_2} \mathcal{B}(v) : \mathcal{B}(\tau)$ and $\mathcal{B}(\Delta); \mathcal{B}(\Gamma),\, x : \mathcal{B}(\tau) \vdash_{C_2} \mathcal{B}(e)$
By (TD-SUB) rule, $\mathcal{B}(\Delta); \mathcal{B}(\Gamma) \vdash_{C_2} \text{let}\, x = \mathcal{B}(v) \,\text{in}\, \mathcal{B}(e)$

10. $e_0 = \text{let}\, x = \pi_i(v) \,\text{in}\, e$, $\mathcal{B}(e_0) = \text{let}\, x = \pi_i(\mathcal{B}(v)) \,\text{in}\, \mathcal{B}(e)$
By (TC-PROJECT), $\Delta; \Gamma \vdash_C v : \langle \tau_1, \cdots, \tau_n \rangle$, and $\Delta; \Gamma,\, x : \tau_i \vdash_C e$
By induction, $\mathcal{B}(\Delta); \mathcal{B}(\Gamma) \vdash_{C_2} \mathcal{B}(v) : \langle \overrightarrow{\mathcal{B}(\tau_i)} \rangle$ and $\mathcal{B}(\Delta); \mathcal{B}(\Gamma),\, x : \mathcal{B}(\tau_i) \vdash_{C_2} \mathcal{B}(e)$
By (TD-PROJECT) rule, $\mathcal{B}(\Delta); \mathcal{B}(\Gamma) \vdash_{C_2} \text{let}\, x = \pi_i(\mathcal{B}(v)) \,\text{in}\, \mathcal{B}(e)$

11. $e_0 = \text{let}\, x = v_1\, p\, v_2 \,\text{in}\, e$, $\mathcal{B}(e_0) = \text{let}\, x = \langle (\pi_1(\mathcal{B}(v_1)))\, p\, (\pi_1(\mathcal{B}(v_2))) \rangle \,\text{in}\, \mathcal{B}(e)$
By (TC-OP), we know $\Delta; \Gamma \vdash_C v_1 : \text{int}$, $\Delta; \Gamma \vdash_C v_2 : \text{int}$,
and $\Delta; \Gamma,\, x : \text{int} \vdash_C e$
By induction, $\mathcal{B}(\Delta); \mathcal{B}(\Gamma) \vdash_{C_2} \mathcal{B}(v_1) : \langle \text{int} \rangle$,
$\mathcal{B}(\Delta); \mathcal{B}(\Gamma) \vdash_{C_2} \mathcal{B}(v_2) : \langle \text{int} \rangle$, $\mathcal{B}(\Delta); \mathcal{B}(\Gamma),\, x : \langle \text{int} \rangle \vdash_{C_2} \mathcal{B}(e)$
By (TD-PROJECT), $\mathcal{B}(\Delta); \mathcal{B}(\Gamma) \vdash_{C_2} \pi_1(\mathcal{B}(v_1)) : \text{int}$
By (TD-PROJECT), $\mathcal{B}(\Delta); \mathcal{B}(\Gamma) \vdash_{C_2} \pi_1(\mathcal{B}(v_2)) : \text{int}$
By (TD-TUPLE) and (TD-OP), $\mathcal{B}(\Delta); \mathcal{B}(\Gamma) \vdash_{C_2} \langle (\pi_1(\mathcal{B}(v_1)))\, p\, (\pi_1(\mathcal{B}(v_2))) \rangle : \langle \text{int} \rangle$
By (TD-VAR), $\mathcal{B}(\Delta); \mathcal{B}(\Gamma) \vdash_{C_2} \mathcal{B}(e_0)$

12. $e_0 = \text{let}\, [\alpha, x] = \text{unpack}\, v \,\text{in}\, e$, $\mathcal{B}(e_0) = \text{let}\, [\alpha, x] = \text{unpack}\, \mathcal{B}(v) \,\text{in}\, \mathcal{B}(e)$
From (TC-UNPACK), we know $\Delta; \Gamma \vdash_C v : \exists \alpha.\tau$, and
$(\Delta, \alpha); (\Gamma, x : \tau) \vdash_C e$
By induction, $\mathcal{B}(\Delta); \mathcal{B}(\Gamma) \vdash_{C_2} \mathcal{B}(v) : \exists \alpha : \text{ptr}.\mathcal{B}(\tau)$
$\mathcal{B}(\Delta),\, \alpha : \text{ptr}; \mathcal{B}(\Gamma),\, x : \mathcal{B}(\tau) \vdash_{C_2} \mathcal{B}(e)$
By (TD-UNPACK) rule, $\mathcal{B}(\Delta); \mathcal{B}(\Gamma) \vdash_{C_2} \text{let}\, [\alpha, x] = \text{unpack}\, \mathcal{B}(v) \,\text{in}\, \mathcal{B}(e)$

13. $v = x$, $\mathcal{B}(v) = x$
From (TC-VAR), $\Delta; \Gamma, x : \tau \vdash_C x : \tau$

From (TD-VAR), $\mathcal{B}(\Delta); \mathcal{B}(\Gamma), x : \mathcal{B}(\tau) \vdash_{C_2} x : \mathcal{B}(\tau)$

14. $v = i$, $\mathcal{B}(v) = \langle i \rangle$
By (TC-INT), $\Delta; \Gamma \vdash_C i : \text{int}$
By (TD-INT), $\mathcal{B}(\Delta); \mathcal{B}(\Gamma) \vdash_{C_2} i : \text{int}$,
and by (TD-TUPLE), $\mathcal{B}(\Delta); \mathcal{B}(\Gamma) \vdash_{C_2} \langle i \rangle : \langle \text{int} \rangle$

15. $v = \langle \overrightarrow{v} \rangle$, $\mathcal{B}(v) = \langle \overrightarrow{\mathcal{B}(v)} \rangle$
By (TC-TUPLE), $\Delta; \Gamma \vdash_C \langle \overrightarrow{v} \rangle : \langle \overrightarrow{\tau} \rangle$, and $\Delta; \Gamma \vdash_C v_i : \tau_i$
By induction, $\mathcal{B}(\Delta); \mathcal{B}(\Gamma) \vdash_{C_2} \mathcal{B}(v_i) : \mathcal{B}(\tau_i)$
By (TD-TUPLE) rule, $\mathcal{B}(\Delta); \mathcal{B}(\Gamma) \vdash_{C_2} \langle \overrightarrow{\mathcal{B}(v)} \rangle : \langle \overrightarrow{\mathcal{B}(\tau)} \rangle$

16. $v_0 = v[\tau]$, $\mathcal{B}(v_0) = \langle (\pi_1(\mathcal{B}(v)))[\mathcal{B}(\tau)] \rangle$
From (TC-TAPP), $\Delta; \Gamma \vdash_C v : \forall[\alpha, \overrightarrow{\beta}].\overrightarrow{\tau'} \to \text{void}$, and $\Delta \vdash_C \tau$
By induction, $\mathcal{B}(\Delta); \mathcal{B}(\Gamma) \vdash_{C_2} \mathcal{B}(v) : \langle \forall[\alpha : \text{ptr}, \overrightarrow{\beta : \text{ptr}}].\overrightarrow{\mathcal{B}(\tau')} \to \text{void} \rangle$,
and $\mathcal{B}(\Delta) \vdash_{C_2} \mathcal{B}(\tau) : \text{ptr}$
By (TD-PROJECT), $\mathcal{B}(\Delta); \mathcal{B}(\Gamma) \vdash_{C_2} (\pi_1 \mathcal{B}(v)) : \forall[\alpha : \text{ptr}, \overrightarrow{\beta : \text{ptr}}].\overrightarrow{\mathcal{B}(\tau')} \to \text{void}$
By (TD-TAPP), we obtain
$\mathcal{B}(\Delta); \mathcal{B}(\Gamma) \vdash_{C_2} \pi_1(\mathcal{B}(v))[\mathcal{B}(\tau)] : \forall \overrightarrow{\beta : \text{ptr}}.\overrightarrow{\mathcal{B}(\tau')}[\mathcal{B}(\tau)/\alpha] \to \text{void}$
By the Lemma above, $\forall \overrightarrow{\beta : \text{ptr}}.\overrightarrow{\mathcal{B}(\tau')}[\mathcal{B}(\tau)/\alpha] \to \text{void} = \forall \overrightarrow{\beta : \text{ptr}}.\overrightarrow{\mathcal{B}([\tau/\alpha]\tau')} \to \text{void}$
and $\langle \forall \overrightarrow{\beta : \text{ptr}}.\overrightarrow{\mathcal{B}([\tau/\alpha]\tau')} \to \text{void} \rangle = \mathcal{B}(\forall \overrightarrow{\beta}.\overrightarrow{[\tau/\alpha]\tau'} \to \text{void})$
Thus by (TD-TUPLE), $\mathcal{B}(\Delta); \mathcal{B}(\Gamma) \vdash_{C_2} \langle (\pi_1(\mathcal{B}(v)))[\mathcal{B}(\tau)] \rangle : \mathcal{B}(\forall \overrightarrow{\beta}.\overrightarrow{[\tau/\alpha]\tau'} \to \text{void})$

17. $e = fixcode\, x[\overrightarrow{\alpha}](\overrightarrow{x : \tau}).e$, $\mathcal{B}(e) = \langle fixcode\, x_0[\overrightarrow{\alpha : \text{ptr}}](\overrightarrow{x : \mathcal{B}(\tau)}).\text{let}\, x = \langle x_0 \rangle \,\text{in}\, \mathcal{B}(e) \rangle$
From (TC-FIX), $\overrightarrow{\alpha} \vdash_C \tau_i$, $\overrightarrow{\alpha}; x : \forall[\overrightarrow{\alpha}].(\overrightarrow{\tau}) \to \text{void}, x_1 : \tau_1, \cdots, x_n : \tau_n \vdash_C e$
By induction, $\overrightarrow{\alpha : \text{ptr}} \vdash_{C_2} \mathcal{B}(\tau_i) : \text{ptr}$,
$\overrightarrow{\alpha : \text{ptr}}; x : \langle \forall[\overrightarrow{\alpha : \text{ptr}}].(\overrightarrow{\mathcal{B}(\tau)}) \to \text{void} \rangle, x_1 : \mathcal{B}(\tau_1), \cdots, x_n : \mathcal{B}(\tau_n) \vdash_{C_2} \mathcal{B}(e)$
we know $x_0 : \forall[\overrightarrow{\alpha : \text{ptr}}].(\overrightarrow{\mathcal{B}(\tau)}) \to \text{void} \vdash_{C_2} \langle x_0 \rangle : \langle \forall[\overrightarrow{\alpha : \text{ptr}}].(\overrightarrow{\mathcal{B}(\tau)}) \to \text{void} \rangle$
By weakening lemma, $\overrightarrow{\alpha : \text{ptr}}; x : \langle \forall[\overrightarrow{\alpha : \text{ptr}}].(\overrightarrow{\mathcal{B}(\tau)}) \to \text{void} \rangle, x_1 : \mathcal{B}(\tau_1), \cdots, x_n : \mathcal{B}(\tau_n), x_0 : \forall[\overrightarrow{\alpha : \text{ptr}}].(\overrightarrow{\tau}) \to \text{void} \vdash_{C_2} \mathcal{B}(e)$
By (TD-SUB), $\overrightarrow{\alpha : \text{ptr}}; x_1 : \mathcal{B}(\tau_1), \cdots, x_n : \mathcal{B}(\tau_n), x_0 : \forall[\overrightarrow{\alpha : \text{ptr}}].(\overrightarrow{\mathcal{B}(\tau)}) \to \text{void} \vdash_{C_2} \text{let}\, x = \langle x_0 \rangle \,\text{in}\, \mathcal{B}(e)$
By (TD-FIX), $\mathcal{B}(\Delta); \mathcal{B}(\Gamma) \vdash_{C_2} fixcode\, x_0[\overrightarrow{\alpha : \text{ptr}}](\overrightarrow{x : \mathcal{B}(\tau)}).\text{let}\, x = \langle x_0 \rangle \,\text{in}\, \mathcal{B}(e) : \forall[\overrightarrow{\alpha : \text{ptr}}].(\overrightarrow{\tau}) \to \text{void}$
By (TD-TUPLE), $\mathcal{B}(\Delta); \mathcal{B}(\Gamma) \vdash_{C_2} \langle fixcode\, x_0[\overrightarrow{\alpha : \text{ptr}}](\overrightarrow{x : \mathcal{B}(\tau)}).\text{let}\, x = \langle x_0 \rangle \,\text{in}\, \mathcal{B}(e) \rangle : \langle \forall[\overrightarrow{\alpha : \text{ptr}}].(\overrightarrow{\tau}) \to \text{void} \rangle$

18. $e = \text{pack}[\tau, v]\,\text{as}\,\exists\alpha : K.\tau'$, $\mathcal{B}(e) = \text{pack}[\mathcal{B}(\tau), \mathcal{B}(v)]\,\text{as}\,\exists\alpha : \text{ptr}.\mathcal{B}(\tau')$
From (TC-PACK), $\Delta \vdash_C \tau$, $\Delta; \Gamma \vdash_C v : \tau'[\tau/\alpha]$
By induction, we get $\mathcal{B}(\Delta) \vdash_{C_2} \mathcal{B}(\tau) : \text{ptr}$, $\mathcal{B}(\Delta); \mathcal{B}(\Gamma) \vdash_{C_2} \mathcal{B}(v) : \mathcal{B}(\tau'[\tau/\alpha])$
By lemma 1, we can write $\mathcal{B}(\Delta); \mathcal{B}(\Gamma) \vdash_{C_2} \mathcal{B}(v) : \mathcal{B}(\tau')[\mathcal{B}(\tau)/\alpha]$
By (TD-PACK) rule, $\mathcal{B}(\Delta); \mathcal{B}(\Gamma) \vdash_{C_2} \mathcal{B}(e) : \exists\alpha : \text{ptr}.\mathcal{B}(\tau')$

9.2 Converting λ^{C_2} to λ^{flat}

Translating λ^{C_2} to λ^{low} requires some effort to break up nested tuple allocations, so we define a "flattened" variant of λ^{C_2} called λ^{flat} to factor out this effort ahead of time. λ^{flat} is strictly a subset of λ^{C_2}: they share the same kind

and type systems, and any λ^{flat} expression is also a λ^{C_2} expression:

$K = \text{primitive} \mid \text{ptr}$

$\tau = \alpha \mid \text{int} \mid \forall[\overrightarrow{\alpha : K}].(\overrightarrow{\tau}) \to \text{void} \mid \langle \overrightarrow{\tau} \rangle \mid \exists \alpha : K.\tau$

$e = x(\overrightarrow{x}) \mid \text{if0}(x,\, e_1,\, e_2) \mid \text{halt}[\tau]x \mid \text{let } x = t \text{ in } e \mid \text{let } x_0 = \pi_i x \text{ in } e$
$\mid \text{let } [\alpha, x] = \text{unpack } x_0 \text{ in } e \mid \text{let } x_0 = \langle \overrightarrow{x} \rangle \text{ in } e$

$t = x \mid i \mid x[\tau] \mid \underline{\text{pack}}[\tau,\, x] \text{ as } \exists \alpha : K.\tau' \mid x_1\, p\, x_2$
$\mid fixcode\, x[\overrightarrow{\alpha : K}](\overrightarrow{x : \tau}).e$

$p = + \mid - \mid *$

Type Checking Rules For λ^{Flat}

(KF-VAR) $\Delta, \alpha : K \vdash \alpha : K$

(KF-INT) $\Delta \vdash \text{int:primitive}$

(KF-ALL) $$\frac{\Delta,\, \overrightarrow{\alpha : K} \vdash \tau_i : K_i}{\Delta \vdash \forall[\overrightarrow{\alpha : K}].(\overrightarrow{\tau}) \to \text{void} : \text{primitive}}$$

(KF-TUPLE) $$\frac{\Delta \vdash \tau_i : K_i}{\Delta \vdash \langle \overrightarrow{\tau} \rangle : \text{ptr}}$$

(KF-SOME) $$\frac{\Delta,\, \alpha : K \vdash \tau : K'}{\Delta \vdash (\exists \alpha : K.\tau) : K'}$$

(TF-APP) $$\frac{\Delta; \Gamma \vdash x : (\tau_1, \cdots, \tau_n) \to \text{void} \quad \Delta; \Gamma \vdash x_i : \tau_i}{\Delta; \Gamma \vdash x(\overrightarrow{x})}$$

(TF-IF) $$\frac{\Delta; \Gamma \vdash x : \text{int} \quad \Delta; \Gamma \vdash e_1 \quad \Delta; \Gamma \vdash e_2}{\Delta; \Gamma \vdash \text{if0}(x,\, e_1,\, e_2)}$$

(TF-HALT) $$\frac{\Delta; \Gamma \vdash x : \tau}{\Delta; \Gamma \vdash \text{halt}[\tau]x}$$

(TF-LET) $$\frac{\Delta; \Gamma \vdash t : \tau \quad \Delta; \Gamma,\, x : \tau \vdash e}{\Delta; \Gamma \vdash \text{let } x = t \text{ in } e}\ (x \notin \Gamma)$$

(TF-PROJECT) $$\frac{\Delta; \Gamma \vdash x : \langle \tau_1, \cdots, \tau_n \rangle \quad \Delta; \Gamma,\, x_0 : \tau_i \vdash e}{\Delta; \Gamma \vdash \text{let } x_0 = \pi_i x \text{ in } e}\ (x \notin \Gamma \wedge 1 \le i \le n)$$

(TF-UNPACK) $$\frac{\Delta; \Gamma \vdash x_0 : \exists \alpha : K.\tau \quad (\Delta, \alpha : K); (\Gamma, x : \tau) \vdash e}{\Delta; \Gamma \vdash \text{let } [\alpha, x] = \text{unpack } x_0 \text{ in } e}\ (x \notin \Gamma \wedge \alpha \notin \Delta)$$

(TF-TUPLE) $$\frac{\Delta; \Gamma \vdash x_i : \tau_i \quad \Delta; \Gamma,\, x_0 : \langle \tau_1, \cdots, \tau_n \rangle \vdash e}{\Delta; \Gamma \vdash \text{let } x_0 = \langle \overrightarrow{x} \rangle \text{ in } e}\ (x_0 \notin \Gamma)$$

(TF-OP) $$\frac{\Delta; \Gamma \vdash x_1 : \text{int} \quad \Delta; \Gamma \vdash x_2 : \text{int}}{\Delta; \Gamma \vdash x_1\, p\, x_2 \ : \text{int}}$$

(TF-VAR) $\Delta; \Gamma, x : \tau \vdash x : \tau$

(TF-INT) $\Delta; \Gamma \vdash i : \text{int}$

(TF-TAPP) $$\frac{\Delta \vdash \tau_0 : K \quad \Delta; \Gamma \vdash x : \forall[\alpha : K, \overrightarrow{\beta : K'}].(\overrightarrow{\tau}) \to \text{void}}{\Delta; \Gamma \vdash x[\tau_0] : (\forall[\overrightarrow{\beta : K'}].(\overrightarrow{\tau}[\tau_0/\alpha]) \to \text{void})}$$

$$\text{(TF-PACK)}\quad \frac{\Delta \vdash \tau : K \quad \Delta;\Gamma \vdash x : \tau'[\tau/\alpha]}{\Delta;\Gamma \vdash \text{pack}[\tau,\, x]\,\text{as}\,\exists\alpha : K.\tau' :\ \exists\alpha : K.\tau'}$$

$$\text{(TF-FIX)}\quad \frac{\overrightarrow{\alpha : K} \vdash \tau_i : K_i' \quad \overrightarrow{\alpha : K};\, x : \forall[\overrightarrow{\alpha : K}].(\overrightarrow{\tau}) \to \text{void},\, x_1 : \tau_1,\, \cdots,\, x_n : \tau_n \vdash e}{\Delta;\Gamma \vdash\ fixcode\, x[\overrightarrow{\alpha : K}](\overrightarrow{x : \tau}).e\ \ : \forall[\overrightarrow{\alpha : K}].(\overrightarrow{\tau}) \to \text{void}}$$

$$\text{(TF-ENV)}\quad \frac{\Delta \vdash \tau_i : K_i}{\Delta \vdash\ \{x_1 \mapsto \tau_1, \ldots, x_n \mapsto \tau_n\}}$$

To aid the conversion, define a declaration d as:

$d = x = t \,|\, x = \pi_i x' \,|\, x = \langle \overrightarrow{x} \rangle$

Say that $(\text{let}\, d_1, \ldots, d_n \,\text{in}\, e)$ is short for $(\text{let}\, d_1 \,\text{in} \ldots \text{let}\, d_n \,\text{in}\, e)$.
Also define abbreviations for typing declarations and typing terms prefixed by sequences of declarations:

$\Delta;\Gamma \vdash (x = t) : (x \mapsto \tau) \Leftrightarrow \Delta;\Gamma \vdash t : \tau$

$\Delta;\Gamma \vdash (x = \pi_i x') : (x \mapsto \tau) \Leftrightarrow \Delta;\Gamma \vdash x' : \langle \tau_1, \cdots, \tau_n \rangle \quad \tau = \tau_i$

$\Delta;\Gamma \vdash (x = \langle \overrightarrow{x} \rangle) : (x \mapsto \langle \overrightarrow{\tau} \rangle) \Leftrightarrow \Delta;\Gamma \vdash x_i : \tau_i$

$$\begin{array}{rcl} \Delta;\Gamma \vdash d_1, \ldots, d_n, t : \tau & \Leftrightarrow & (\Delta;\Gamma \vdash d_1 : (x_1 \mapsto \tau_1)) \\ & & \wedge(\Delta;\Gamma, (x_1 \mapsto \tau_1) \vdash d_2, \ldots, d_n, t : \tau) \end{array}$$

The conversion from λ^{C_2} to λ^{flat} changes expressions e to expressions $\mathcal{F}(e)$ and
changes values v to declarations followed by terms $\mathcal{F}(v) = \overrightarrow{d}, t$. It does not modify types or kinds.

$\mathcal{F}(x) = x$

$\mathcal{F}(i) = i$

$\mathcal{F}(v[\tau]) = \overrightarrow{d},\, x = t,\, x[\tau]$
where $\mathcal{F}(v) = \overrightarrow{d},\, t$

$\mathcal{F}(\langle \overrightarrow{v} \rangle) = \overrightarrow{d},\, \overrightarrow{x = t},\, x_0 = \langle \overrightarrow{x} \rangle,\, x_0$
where $\mathcal{F}(v_i) = \overrightarrow{d_i},\, t_i$

$\mathcal{F}(\pi_i v) = \overrightarrow{d},\, x_1 = t,\, x_2 = \pi_i x_1,\, x_2$
where $\mathcal{F}(v) = \overrightarrow{d},\, t$

$\mathcal{F}(\text{pack}[\tau, v]\, as\, \exists\alpha : K.\tau') = \overrightarrow{d},\, x = t,\, \text{pack}[\tau, x]\, as\, \exists\alpha : K.\tau'$
where $\mathcal{F}(v) = \overrightarrow{d},\, t$

$\mathcal{F}(fixcode\, x[\overrightarrow{\alpha : K}](\overrightarrow{x : \tau}).e) = fixcode\, x[\overrightarrow{\alpha : K}](\overrightarrow{x : \tau}).\mathcal{F}(e)$

$\mathcal{F}(v(\overrightarrow{v})) = \text{let}\ \overrightarrow{d},\, \overrightarrow{d_1}, \cdots, \overrightarrow{d_n}, x = t, \overrightarrow{x = t}\,\text{in}\, x(\overrightarrow{x})$
where $\mathcal{F}(v_i) = \overrightarrow{d_i},\, t_i,\ \ \mathcal{F}(v) = \overrightarrow{d},\, t$

$\mathcal{F}(\text{if0}(v,\, e_1,\, e_2)) = \text{let}\ \overrightarrow{d}, x = t\,\text{in}\,\text{if0}(x,\, \mathcal{F}(e_1),\, \mathcal{F}(e_2))$

where $\mathcal{F}(v) = \overrightarrow{d}, t$

$\mathcal{F}(\text{halt}[\tau]v) = \text{let } \overrightarrow{d}, x = t \text{ in halt}[\tau]x$
where $\mathcal{F}(v) = \overrightarrow{d}, t$

$\mathcal{F}(\text{let } x = v \text{ in } e) = \text{let } \overrightarrow{d} \text{ in let } x = t \text{ in } \mathcal{F}(e)$
where $\mathcal{F}(v) = \overrightarrow{d}, t$

$\mathcal{F}(\text{let } x_0 = v_1\, p\, v_2 \text{ in } e) = \text{let } \overrightarrow{d_1}, \overrightarrow{d_2}, x_1 = t_1, x_2 = t_2 \text{ in let } x_0 = x_1\, p\, x_2 \text{ in } \mathcal{F}(e)$
where $\mathcal{F}(v_1) = \overrightarrow{d_1}, t_1, \mathcal{F}(v_2) = \overrightarrow{d_2}, t_2$

$\mathcal{F}(\text{let } [\alpha, x] = \text{unpack } v \text{ in } e) = \text{let } \overrightarrow{d}, x_0 = t \text{ in let } [\alpha, x] = \text{unpack } x_0 \text{ in } \mathcal{F}(e)$
where $\mathcal{F}(v) = \overrightarrow{d}, t$

Correctness :

1. If $\Delta \vdash_{C_2} \tau : K$, then $\Delta \vdash_F \tau : K$
2. If $\Delta \vdash_{C_2} \Gamma$, then $\Delta \vdash_F \Gamma$
3. If $\Delta; \Gamma \vdash_{C_2} e$, then $\Delta; \Gamma \vdash_F \mathcal{F}(e)$
4. If $\Delta; \Gamma \vdash_{C_2} v : \tau$, then $\Delta; \Gamma \vdash_F \mathcal{F}(v) : \tau$

Proof :
Prove by induction on typing derivations.

1. τ and Γ
The rules for$\vdash_F$ are the same as for $\vdash_{C_2}$, so $\Delta \vdash_{C_2} \tau : K$ implies $\Delta \vdash_F \tau : K$,
and $\Delta \vdash_{C_2} \Gamma$ implies $\Delta \vdash_F \Gamma$

2. $v = x$: the TD-VAR and TF-VAR rules are identical

3. $v = i$, $\mathcal{F}(v) = i$
Because $\Delta \vdash_{C_2} i : \text{int}$, then $\Delta \vdash_F \mathcal{F}(v) : \text{int}$

4. $v_0 = v[\tau_0]$, $\mathcal{F}(v[\tau_0]) = \overrightarrow{d}, x = t, x[\tau_0]$, where $\mathcal{F}(v) = \overrightarrow{d}, t$
From (TD-TAPP), we know $\Delta \vdash_{C_2} \tau_0 : K$,
and $\Delta; \Gamma \vdash_{C_2} v : \forall[\alpha : K, \overrightarrow{\beta : K'}].(\overrightarrow{\tau}) \to \text{void}$
By induction, $\Delta \vdash_F \tau_0 : K$, and $\Delta; \Gamma \vdash_F \overrightarrow{d}, t : \forall[\alpha : K, \overrightarrow{\beta : K'}].(\overrightarrow{\tau}) \to \text{void}$
By (TF-VAR), $\Delta; \Gamma \vdash_F \overrightarrow{d}, x = t, x : \forall[\alpha : K, \overrightarrow{\beta : K'}].(\overrightarrow{\tau}) \to \text{void}$
By (TF-TAPP), $\Delta; \Gamma \vdash_F \overrightarrow{d}, x = t, x[\tau_0] : (\forall[\overrightarrow{\beta : K'}].(\overrightarrow{\tau}[\tau_0/\alpha]) \to \text{void})$

5. $v = \langle \overrightarrow{v} \rangle$, $\mathcal{F}(\langle \overrightarrow{v} \rangle) = \overrightarrow{d}, \overrightarrow{x = t}, x_0 = \langle \overrightarrow{x} \rangle, x_0$; $\quad \mathcal{F}(v_i) = \overrightarrow{d_i}, t_i$
From (TD-TAPP), we know $\Delta; \Gamma \vdash_{C_2} v_i : \tau_i$.
By induction, $\Delta; \Gamma \vdash_F \overrightarrow{d_i}, t_i : \tau_i$.
By weakening, $\Delta; \Gamma \vdash_F \overrightarrow{d}, t_i : \tau_i$.
By weakening and (TF-VAR), $\Delta; \Gamma \vdash_F \overrightarrow{d}, \overrightarrow{x = t}, x_i : \tau_i$.
By (TF-VAR), $\Delta; \Gamma \vdash_F \overrightarrow{d}, \overrightarrow{x = t}, x_0 = \langle \overrightarrow{x} \rangle, x_0 : \langle \overrightarrow{\tau} \rangle$

6. $v = \text{pack}[\tau, v]\, as\, \exists\alpha : K.\tau'$,
$\mathcal{F}(\text{pack}[\tau, v]\, as\, \exists\alpha : K.\tau') = \overrightarrow{d}, x = t, \text{pack}[\tau, x]\, as\, \exists\alpha : K.\tau'$; $\mathcal{F}(v) = \overrightarrow{d}, t$

From (TD-PACK), we know $\Delta \vdash_{C_2} \tau : K \quad , \Delta; \Gamma \vdash_{C_2} v : \tau'[\tau/\alpha]$.
By induction, $\Delta \vdash_F \tau : K \quad , \Delta; \Gamma \vdash_F \overrightarrow{d}, t : \tau'[\tau/\alpha]$.
By (TF-VAR), $\Delta; \Gamma \vdash_F \overrightarrow{d}, x = t, x : \tau'[\tau/\alpha]$.
By (TF-PACK), $\Delta; \Gamma \vdash_F \overrightarrow{d}, x = t, \text{pack}[\tau, x] \text{ as } \exists\alpha : K.\tau' : \exists\alpha : K.\tau'$

7. $v = fixcode\, x[\overrightarrow{\alpha : K}](\overrightarrow{x : \tau}).e$, $\mathcal{F}(v) = fixcode\, x[\overrightarrow{\alpha : K}](\overrightarrow{x : \tau}).\mathcal{F}(e)$
From (TD-FIX), $\overrightarrow{\alpha : K} \vdash_{C_2} \tau_i : K_i' \quad ,$
and $\overrightarrow{\alpha : K}; x : \forall[\overrightarrow{\alpha : K}].(\overrightarrow{\tau}) \to \text{void}, x_1 : \tau_1, \cdots, x_n : \tau_n \vdash_{C_2} e$
By induction, we get $\overrightarrow{\alpha : K} \vdash_F \tau_i : K_i' \quad ,$
and $\overrightarrow{\alpha : K}; x : \forall[\overrightarrow{\alpha : K}].(\overrightarrow{\tau}) \to \text{void}, x_1 : \tau_1, \cdots, x_n : \tau_n \vdash_F \mathcal{F}(e)$
By (TF-FIX) rule, $\Delta; \Gamma \vdash_F fixcode\, x[\overrightarrow{\alpha : K}](\overrightarrow{x : \tau}).\mathcal{F}(e) : \forall[\overrightarrow{\alpha : K}].(\overrightarrow{\tau}) \to \text{void}$

8. $e = v(\overrightarrow{v})$, $\mathcal{F}(e) = \text{let } \overrightarrow{d}, \overrightarrow{d_1}, \cdots, \overrightarrow{d_n}, x = t, \overrightarrow{x = t} \text{ in } x(\overrightarrow{x})$; $\mathcal{F}(v_i) = \overrightarrow{d_i}, t_i$, $\mathcal{F}(v) = \overrightarrow{d}, t$
From (TD-APP), we can get $\Delta; \Gamma \vdash_{C_2} v : (\tau_1, \cdots, \tau_n) \to \text{void} \quad \Delta; \Gamma \vdash_{C_2} v_i : \tau_i$.
By induction, $\Delta; \Gamma \vdash_F \overrightarrow{d}, t : (\tau_1, \cdots, \tau_n) \to \text{void} \quad \Delta; \Gamma \vdash_F \overrightarrow{d_i}, t_i : \tau_i$.
By weakening, $\Delta; \Gamma \vdash_F \overrightarrow{d}, \overrightarrow{d_1}, \cdots, \overrightarrow{d_n}, t : (\tau_1, \cdots, \tau_n) \to \text{void} \quad \Delta; \Gamma \vdash_F \overrightarrow{d}, \overrightarrow{d_1}, \cdots, \overrightarrow{d_n}, t_i : \tau_i$.
By weakening and (TF-VAR), $\Delta; \Gamma \vdash_F \overrightarrow{d}, \overrightarrow{d_1}, \cdots, \overrightarrow{d_n}, x = t, \overrightarrow{x = t}, x : (\tau_1, \cdots, \tau_n) \to \text{void}$
and $\Delta; \Gamma \vdash_F \overrightarrow{d}, \overrightarrow{d_1}, \cdots, \overrightarrow{d_n}, , x = t, \overrightarrow{x = t}, x : \tau_i$.
By (TF-LET/TF-PROJECT/TF-TUPLE) and (TF-APP), $\Delta; \Gamma \vdash_F \text{let } \overrightarrow{d}, \overrightarrow{d_1}, \cdots, \overrightarrow{d_n}, x = t, \overrightarrow{x = t} \text{ in } x(\overrightarrow{x})$.

9. $e = \text{if0}(v, e_1, e_2)$, $\mathcal{F}(e) = \text{let } \overrightarrow{d}, x = t \text{ in if0}(x, \mathcal{F}(e_1), \mathcal{F}(e_2))$; $\mathcal{F}(v) = \overrightarrow{d}, t$
From (TD-IF), we know $\Delta; \Gamma \vdash_{C_2} v : \text{int}$, $\Delta; \Gamma \vdash_{C_2} e_1$ $\Delta; \Gamma \vdash_{C_2} e_2$.
By induction, $\Delta; \Gamma \vdash_F \overrightarrow{d}, t : \text{int}$, $\Delta; \Gamma \vdash_F \mathcal{F}(e_1)$, $\Delta; \Gamma \vdash_F \mathcal{F}(e_2)$.
By (TF-VAR) and weakening, $\Delta; \Gamma \vdash_F \overrightarrow{d}, x = t, x : \text{int}$.
By weakening, (TF-LET/TF-PROJECT/TF-TUPLE), and (TF-IF), $\Delta; \Gamma \vdash_F \text{let } \overrightarrow{d}, x = t \text{ in if0}(x, \mathcal{F}(e_1), \mathcal{F}(e_2))$

10. $e = \text{halt}[\tau]v$, $\mathcal{F}(\text{halt}[\tau]v) = \text{let } \overrightarrow{d}, x = t \text{ in halt}[\tau]x$; $\mathcal{F}(v) = \overrightarrow{d}, t$
From (TD-HALT), we know $\Delta; \Gamma \vdash_{C_2} v : \tau$.
By induction, $\Delta; \Gamma \vdash_F \overrightarrow{d}, t : \tau$.
By (TF-VAR) and weakening, $\Delta; \Gamma \vdash_F \overrightarrow{d}, x = t, x : \tau$.
By (TF-LET/TF-PROJECT/TF-TUPLE) and (TF-HALT), $\Delta; \Gamma \vdash_F \text{let } \overrightarrow{d}, x = t \text{ in halt}[\tau]x$

11. $e = \text{let } x = v \text{ in } e$, $\mathcal{F}(\text{let } x = v \text{ in } e) = \text{let } \overrightarrow{d} \text{ in let } x = t \text{ in } \mathcal{F}(e)$; $\mathcal{F}(v) = \overrightarrow{d}, t$
From (TD-SUB) rule, $\Delta; \Gamma \vdash_{C_2} v : \tau$, $\Delta; \Gamma, x : \tau \vdash_{C_2} e$.
By induction, $\Delta; \Gamma \vdash_{C_2} \overrightarrow{d}, t : \tau$, $\Delta; \Gamma, x : \tau \vdash_{C_2} \mathcal{F}(e)$.
By weakening and (TF-LET/TF-PROJECT/TF-TUPLE), $\Delta; \Gamma \vdash \mathcal{F}(\text{let } x = v \text{ in } e)$

12. $v_0 = \pi_i v$, $\mathcal{F}(v_0) = \overrightarrow{d}, x_1 = t, x_2 = \pi_i x_1, x_2$; $\mathcal{F}(v) = \overrightarrow{d}, t$
From (TD-PROJECT) rule, $\Delta; \Gamma \vdash_{C_2} v : \langle \tau_1, \cdots, \tau_n \rangle$.
By induction, $\Delta; \Gamma \vdash_F \overrightarrow{d}, t : \langle \tau_1, \cdots, \tau_n \rangle$.
By (TF-VAR), $\Delta; \Gamma \vdash_F \overrightarrow{d}, x_1 = t, x_1 : \langle \tau_1, \cdots, \tau_n \rangle$.
By (TF-VAR), $\Delta; \Gamma \vdash_F \overrightarrow{d}, x_1 = t, x_2 = \pi_i x_1, x_2 : \tau_i$.

13. $e_0 = \text{let } x_0 = v_1\, p\, v_2 \text{ in } e$, $\mathcal{F}(e_0) = \text{let } \overrightarrow{d_1}, \overrightarrow{d_2}, x_1 = t_1, x_2 = t_2 \text{ in let } x_0 = x_1\, p\, x_2 \text{ in } F(e)$, $\mathcal{F}(v_1) = \overrightarrow{d_1}, t_1$, $\mathcal{F}(v_2) = \overrightarrow{d_2}, t_2$
From (TD-OP), $\Delta; \Gamma \vdash_{C_2} v_1 : \text{int} \quad \Delta; \Gamma \vdash_{C_2} v_2 : \text{int}$, $\Delta; \Gamma, x_0 : \text{int} \vdash_{C_2} e$.
By induction, $\Delta; \Gamma \vdash_F \overrightarrow{d_1}, t_1 : \text{int} \quad \Delta; \Gamma \vdash_F \overrightarrow{d_2}, t_2 : \text{int}$

$\Delta; \Gamma, x_0 : \text{int} \vdash_F \mathcal{F}(e)$.
By weakening, $\Delta; \Gamma \vdash_F \overrightarrow{d_1}, \overrightarrow{d_2}, t_1 : \text{int}$ $\Delta; \Gamma \vdash_F \overrightarrow{d_1}, \overrightarrow{d_2}, t_2 : \text{int}$.
By weakening and (TF-VAR), $\Delta; \Gamma \vdash_F \overrightarrow{d_1}, \overrightarrow{d_2}, x_1 = t_1, x_2 = t_2, x_1 : \text{int}$ $\Delta; \Gamma \vdash_F \overrightarrow{d_1}, \overrightarrow{d_2}, x_1 = t_1, x_2 = t_2, x_2 : \text{int}$.
By (TF-LET/TF-PROJECT/TF-TUPLE), weakening, and (TF-OP), $\Delta; \Gamma \vdash_F \mathcal{F}(e_0)$.

14. $e_0 = \text{let}\,[\alpha, x] = \text{unpack}\,v\,\text{in}\,e$, $\mathcal{F}(e_0) = \text{let}\,\overrightarrow{d}, x_0 = t\,\text{in let}\,[\alpha, x] = \text{unpack}\,x_0\,\text{in}\,\mathcal{F}(e)$; $\mathcal{F}(v) = \overrightarrow{d}, t$
From (TD-UNPACK), $\Delta; \Gamma \vdash v : \exists\alpha : K.\tau$, $(\Delta, \alpha : K); (\Gamma, x : \tau) \vdash e$
By induction, $\Delta; \Gamma \vdash \overrightarrow{d}, t : \exists\alpha : K.\tau$, $(\Delta, \alpha : K); (\Gamma, x : \tau) \vdash \mathcal{F}(e)$
By weakening, $\Delta; \Gamma \vdash \overrightarrow{d}, x_0 = t, x_0 : \exists\alpha : K.\tau$.
By (TF-LET/TF-PROJECT/TF-TUPLE), weakening, and (TF-UNPACK), $\Delta; \Gamma \vdash \mathcal{F}(e_0)$

9.3 Converting λ^{flat} to λ^{low}

Kind conversion

$K_R = \text{int} \to \text{int} \to \text{int} \to \dot{1}$
$\mathcal{A}(\text{primitive}) = \dot{1}$
$\mathcal{A}(\text{ptr}) = \dot{1}$
$\mathcal{A}_{tyarg}(\text{primitive}) = \dot{1}$
$\mathcal{A}_{tyarg}(\text{ptr}) = \text{int} \to K_R \to \text{int} \to \text{int} \to \dot{0}$

Type conversion

We assume that source types have been checked for well-formedness, and we rely on the resulting kind annotations to guide the translation.

$\mathcal{A}(\tau : \text{primitive}) = \lambda R : K_R.\lambda E : \text{int}.\mathcal{A}_{prim}(\tau)$
$\mathcal{A}_{tyarg}(\tau : \text{primitive}) = \mathcal{A}_{prim}(\tau)$
$\mathcal{A}(\tau : \text{ptr}) = \lambda R : K_R.\lambda E : \text{int}.\exists L : \text{int}; L \geq 0.(GcPtr(\mathcal{A}_{ptr}(\tau)\,L\,R)\,E)$
$\mathcal{A}_{tyarg}(\tau : \text{ptr}) = \mathcal{A}_0(\tau : \text{ptr})$
$\mathcal{A}_{ptr}(\tau) = \mu\alpha : \mathcal{A}_{tyarg}(\text{ptr}).\lambda L : \text{int}.\lambda R : K_R.\lambda E : \text{int}.\lambda I : \text{int}.\ \cdot \langle \mathcal{A}_0(\tau)\,L\,R\,E\,I,\ GcCoerce\,L\,R\,(\alpha\,L\,R)\rangle$

$\mathcal{A}_0(\alpha) = \alpha$
$\mathcal{A}_0(\exists\alpha : K.\tau) = \lambda L : \text{int}.\lambda R : K_R.\lambda E : \text{int}.\lambda I : \text{int}.\exists\alpha : \mathcal{A}_{tyarg}(K);\ L \geq 1.(\mathcal{A}_{ptr}(\tau)\,(L-1)\,R\,E\,I)$
$\mathcal{A}_0(\langle\tau_1 : K_1, \cdots, \tau_n : K_n\rangle) = \lambda L : \text{int}.\lambda R : K_R.\lambda E : \text{int}.\lambda I : \text{int}.$
$\quad \cdot\langle\exists F : \text{int} \to \text{int} \to \dot{1}\ .\ \cdot \langle \text{Eq}(F\,0, \mathcal{A}(\tau_1)\,R),\ ...,\ \text{Eq}(F\,(n-1), \mathcal{A}(\tau_n)\,R),\ (GcWord\,R\,E\,I\,(GcHdr\,R\,F\,Tag\,n))\rangle,$
$\qquad (GcWord\,R\,E\,(I+1)\,(\mathcal{A}(\tau_1)\,R)),\ ...,\ (GcWord\,R\,E\,(I+n)\,((\mathcal{A}(\tau_n)\,R)))\rangle$
$\quad where\,Tag = (\sum_{i=1}^{n} 2^{i-1} * tag(K_i)),\ where\,tag(\text{prim}) = 0\,and\,tag(\text{ptr}) = 1$

$\mathcal{A}_{prim}(\exists\alpha : K.\tau) = \exists\alpha : \mathcal{A}_{tyarg}(K).\mathcal{A}_{prim}(\tau)$
$\mathcal{A}_{prim}(\alpha) = \alpha$
$\mathcal{A}_{prim}(\text{int}) = \tau_{int}$
$\mathcal{A}_{prim}(\forall[\overrightarrow{\langle\alpha : K\rangle}].\langle\overrightarrow{\tau}\rangle \to \text{void}) = \forall\overrightarrow{\langle\alpha : \mathcal{A}_{tyarg}(K)\rangle}.\forall R : K_R.\forall E : \text{int}.\hat{}\,\langle\tau_g(R, E),\ \overrightarrow{\langle\mathcal{A}(\tau)\,R\,E\rangle}\rangle \to \tau_{halt}$

$\tau_{int} = \exists I : \text{int}.Int(I)$

Environment conversion:

$$\mathcal{A}_{tyarg}(\{\alpha_1 \mapsto K_1, \ldots, \alpha_n \mapsto K_n\}) = \{\alpha_1 \mapsto \mathcal{A}_{tyarg}(K_1), \ldots, \alpha_n \mapsto \mathcal{A}_{tyarg}(K_n)\}$$

$obj\_load_{\overrightarrow{K},i} : \forall R : K_R.\forall E : \text{int}.\forall \overrightarrow{\alpha : \mathcal{A}_{tyarg}(K)}.{}^\wedge\langle \tau_g(R,E),\, \mathcal{A}(\langle \overrightarrow{\alpha : K}\rangle)\,R\,E\rangle \to^\wedge \langle \tau_g(R,E),\, \mathcal{A}(\alpha_i : K_i)\,R\,E\rangle$

$\emptyset;\emptyset;\emptyset;\emptyset;true;\infty \vdash_L$
$alloc_{\overrightarrow{K},n} : \forall R : K_R.\forall E : \text{int}.\forall \overrightarrow{\alpha : \mathcal{A}_{tyarg}(K)}.\forall \beta_1 : \mathcal{A}_{tyarg}(\text{ptr}).\cdots$
$\forall \beta_n : \mathcal{A}_{tyarg}(\text{ptr}).{}^\wedge\langle \tau_g(R,E),\, \overrightarrow{\mathcal{A}(\alpha : K)\,R\,E},\, \overrightarrow{\mathcal{A}(\beta : \text{ptr})\,R\,E}\rangle \to \exists E'.{}^\wedge\langle \tau_g(R,E'),\, \mathcal{A}(\langle \overrightarrow{\alpha : K}\rangle)\,R\,E',\, \overrightarrow{\mathcal{A}(\beta : \text{ptr})\,R\,E'}\rangle$

Lemma2 :
If $\Delta \vdash \tau_0 : K_0$ and $\Delta, \alpha \mapsto K_0 \vdash \tau : K$, then:

- $\mathcal{A}(\tau)[\mathcal{A}_{tyarg}(\tau_0)/\alpha] = \mathcal{A}(\tau[\tau_0/\alpha])$
- $\mathcal{A}_{prim}(\tau : \text{primitive})[\mathcal{A}_{tyarg}(\tau_0)/\alpha] = \mathcal{A}_{prim}((\tau[\tau_0/\alpha]) : \text{primitive})$
- $\mathcal{A}_{ptr}(\tau : \text{ptr})[\mathcal{A}_{tyarg}(\tau_0)/\alpha] = \mathcal{A}_{ptr}((\tau[\tau_0/\alpha]) : \text{ptr})$
- $\mathcal{A}_0(\tau : \text{ptr})[\mathcal{A}_{tyarg}(\tau_0)/\alpha] = \mathcal{A}_0((\tau[\tau_0/\alpha]) : \text{ptr})$
- $\mathcal{A}_{tyarg}(\tau)[\mathcal{A}_{tyarg}(\tau_0)/\alpha] = \mathcal{A}_{tyarg}((\tau[\tau_0/\alpha]))$

where $\mathcal{A}(\tau[\tau_0/\alpha]), \mathcal{A}_{prim}(\tau[\tau_0/\alpha]), \mathcal{A}_{ptr}(\tau[\tau_0/\alpha]), \mathcal{A}_0(\tau[\tau_0/\alpha])$ are defined based on the judgment $\Delta \vdash \tau[\tau_0/\alpha] : K$.

Proof by induction on τ. For each τ, the $\mathcal{A}(\tau)$ case relies on the $\mathcal{A}_{ptr}(\tau)$ and $\mathcal{A}_{prim}(\tau)$ cases, and the $\mathcal{A}_{ptr}(\tau)$ case relies on the $\mathcal{A}_0(\tau)$ case. The $\mathcal{A}_{tyarg}(\tau)$ case follows directly from the $\mathcal{A}_{prim}(\tau)$ and $\mathcal{A}_0(\tau)$ cases.
1. $\mathcal{A}(\tau : \text{primitive})[\mathcal{A}_{tyarg}(\tau_0)/\alpha]$
$= (\lambda R : K_R.\lambda E : \text{int}.\mathcal{A}_{prim}(\tau))[\mathcal{A}_{tyarg}(\tau_0)/\alpha]$
$= \lambda R : K_R.\lambda E : \text{int}.(\mathcal{A}_{prim}(\tau)[\mathcal{A}_{tyarg}(\tau_0)/\alpha])$
$= \lambda R : K_R.\lambda E : \text{int}.\mathcal{A}_{prim}((\tau[\tau_0/\alpha]) : \text{primitive})$ by the $\mathcal{A}_{prim}(\tau)$ case
$= \mathcal{A}(\tau[\tau_0/\alpha])$

2. $\mathcal{A}(\tau : \text{ptr})[\mathcal{A}_{tyarg}(\tau_0)/\alpha]$
$= (\lambda R : K_R.\lambda E : \text{int}.\exists L : \text{int}; L \geq 0.(GcPtr(\mathcal{A}_{ptr}(\tau)\,L\,R)\,E))[\mathcal{A}_{tyarg}(\tau_0)/\alpha]$
$= \lambda R : K_R.\lambda E : \text{int}.\exists L : \text{int}; L \geq 0.(GcPtr((\mathcal{A}_{ptr}(\tau)[\mathcal{A}_{tyarg}(\tau_0)/\alpha])\,L\,R)\,E)$
$= \lambda R : K_R.\lambda E : \text{int}.\exists L : \text{int}; L \geq 0.(GcPtr(\mathcal{A}_{ptr}((\tau[\tau_0/\alpha]) : \text{ptr})\,L\,R)\,E)$ by the $\mathcal{A}_{ptr}(\tau)$ case
$= \mathcal{A}(\tau[\tau_0/\alpha])$

3. $\mathcal{A}_{ptr}(\tau : \text{ptr})[\mathcal{A}_{tyarg}(\tau_0)/\alpha']$
$= (\mu\alpha : \mathcal{A}_{tyarg}(\text{ptr}).\lambda L : \text{int}.\lambda R : K_R.\lambda E : \text{int}.\lambda I : \text{int}.\ \cdot\langle \mathcal{A}_0(\tau)\,L\,R\,E\,I,\, GcCoerce\,L\,R\,(\alpha\,L\,R)\rangle)[\mathcal{A}_{tyarg}(\tau_0)/\alpha']$
$= \mu\alpha : \mathcal{A}_{tyarg}(\text{ptr}).\lambda L : \text{int}.\lambda R : K_R.\lambda E : \text{int}.\lambda I : \text{int}.\ \cdot\langle (\mathcal{A}_0(\tau)[\mathcal{A}_{tyarg}(\tau_0)/\alpha'])\,L\,R\,E\,I,\, GcCoerce\,L\,R\,(\alpha\,L\,R)\rangle$

$= \mu\alpha : \mathcal{A}_{tyarg}(\text{ptr}).\lambda L : \text{int}.\lambda R : K_R.\lambda E : \text{int}.\lambda I : \text{int}.\cdot\langle \mathcal{A}_0(\tau[\tau_0/\alpha])\, L\, R\, E\, I,\ GcCoerce\, L\, R\, (\alpha\, L\, R)\rangle$ by the $\mathcal{A}_0(\tau)$ case

$= \mathcal{A}_{ptr}(\tau[\tau_0/\alpha])$

4,5,6: We show several cases for $\mathcal{A}_0(\tau)$ and $\mathcal{A}_{prim}(\tau)$. The proofs for the other cases are similar.

4. $\mathcal{A}_0(\alpha : \text{ptr})[\mathcal{A}_{tyarg}(\tau_0)/\alpha] = \alpha[\mathcal{A}_{tyarg}(\tau_0)/\alpha] = \mathcal{A}_{tyarg}(\tau_0)$.
Both α and τ_0 have the same kind $K_0 = \text{ptr}$, so $\mathcal{A}_{tyarg}(\tau_0 : \text{ptr}) = \mathcal{A}_0(\tau_0)$.
Finally, $\mathcal{A}_0(\alpha[\tau_0/\alpha]) = \mathcal{A}_0(\tau_0)$.

5. $\mathcal{A}_{prim}(\alpha : \text{primitive})[\mathcal{A}_{tyarg}(\tau_0)/\alpha] = \alpha[\mathcal{A}_{tyarg}(\tau_0)/\alpha] = \mathcal{A}_{tyarg}(\tau_0)$.
Both α and τ_0 have the same kind $K_0 = \text{primitive}$, so $\mathcal{A}_{tyarg}(\tau_0 : \text{primitive}) = \mathcal{A}_{prim}(\tau_0)$.
Finally, $\mathcal{A}_{prim}(\alpha[\tau_0/\alpha]) = \mathcal{A}_{prim}(\tau_0)$.

6. $\mathcal{A}_0(\exists\beta : K_\beta.\tau)[\mathcal{A}_{tyarg}(\tau_0)/\alpha]$
$= (\lambda L : \text{int}.\lambda R : K_R.\lambda E : \text{int}.\lambda I : \text{int}.\exists\beta : \mathcal{A}_{tyarg}(K_\beta);\ L \geq 1.(\mathcal{A}_{ptr}(\tau)\,(L-1)\,R\,E\,I))[\mathcal{A}_{tyarg}(\tau_0)/\alpha]$
$= \lambda L : \text{int}.\lambda R : K_R.\lambda E : \text{int}.\lambda I : \text{int}.\exists\beta : \mathcal{A}_{tyarg}(K_\beta);\ L \geq 1.((\mathcal{A}_{ptr}(\tau)[\mathcal{A}_{tyarg}(\tau_0)/\alpha])\,(L-1)\,R\,E\,I)$
$= \lambda L : \text{int}.\lambda R : K_R.\lambda E : \text{int}.\lambda I : \text{int}.\exists\beta : \mathcal{A}_{tyarg}(K_\beta);\ L \geq 1.(\mathcal{A}_{ptr}(\tau[\tau_0/\alpha])\,(L-1)\,R\,E\,I)$ by induction
$= \mathcal{A}_0(\exists\beta : K_\beta.\tau[\tau_0/\alpha])$

Correctness :

1. If $\Delta \vdash_F \tau : K$,
then $\emptyset; \mathcal{A}_{tyarg}(\Delta) \vdash_L \mathcal{A}(\tau) : K_R \to \text{int} \to \dot{1}$
(corollary: $\emptyset; \mathcal{A}_{tyarg}(\Delta),\ R : K_R,\ E : \text{int} \vdash_L \mathcal{A}(\tau)\, R\, E : \dot{1}$)
and $\emptyset; \mathcal{A}_{tyarg}(\Delta) \vdash_L \mathcal{A}_{prim}(\tau : \text{primitive}) : \dot{1}$
and $\emptyset; \mathcal{A}_{tyarg}(\Delta) \vdash_L \mathcal{A}_{ptr}(\tau : \text{ptr}) : \text{int} \to K_R \to \text{int} \to \text{int} \to \dot{0}$
and $\emptyset; \mathcal{A}_{tyarg}(\Delta) \vdash_L \mathcal{A}_0(\tau : \text{ptr}) : \text{int} \to K_R \to \text{int} \to \text{int} \to \dot{0}$
and $\emptyset; \mathcal{A}_{tyarg}(\Delta) \vdash_L \mathcal{A}_{tyarg}(\tau) : \mathcal{A}_{tyarg}(K)$
2. If $\Delta \vdash_F \Gamma$ and $\Delta; \Gamma \vdash_F t : \tau$
then $\emptyset; \emptyset; \mathcal{A}_{tyarg}(\Delta),\ R : K_R,\ E : \text{int}; \mathcal{A}(\Gamma)\, R\, E,\ \{g : \tau_g(R,\ E)\}; true; \infty \vdash_L \mathcal{A}(t)\, R\, E\, g : \mathcal{A}(\tau)\, R\, E$,
3. If $\Delta \vdash_F \Gamma$ and $\Delta; \Gamma \vdash_F e$, then $\emptyset; \emptyset; \mathcal{A}_{tyarg}(\Delta),\ R : K_R,\ E : \text{int}; \mathcal{A}(\Gamma) RE,\ \{g : \tau_g(R,\ E)\}; true; \infty \vdash_L \mathcal{A}(e)\, R\, E\, g : \tau_{halt}$

Proof :

Proof by induction on the typing and kinding derivations of t, e, and τ. For each τ, the $\mathcal{A}(\tau)$ case relies on the $\mathcal{A}_{ptr}(\tau)$ and $\mathcal{A}_{prim}(\tau)$ cases, and the $\mathcal{A}_{ptr}(\tau)$ case relies on the $\mathcal{A}_0(\tau)$ case. In order to write the proof concisely, we delete $\Psi = \emptyset, \Phi = \emptyset$, $B = true$, $Limit = \infty$ from environment in the proof.

1. $\Delta \vdash_F \tau : K$,
$\mathcal{A}(\text{primitive}) = \dot{1}$
$\mathcal{A}(\text{ptr}) = \dot{1}$

$case\ 1 : \mathcal{A}(\tau : \text{ptr}) = \lambda R : K_R.\lambda E : \text{int}.\exists L : \text{int}; L \geq 0.(GcPtr(\mathcal{A}_{ptr}(\tau)\, L\, R)\, E)$
By the $\mathcal{A}_{ptr}(\tau)$ case, $\mathcal{A}_{tyarg}(\Delta) \vdash_L \mathcal{A}_{ptr}(\tau) : \text{int} \to K_R \to \text{int} \to \text{int} \to \dot{0}$.
So $\mathcal{A}_{tyarg}(\Delta),\ R : K_R,\ E : \text{int},\ L : \text{int} \vdash_L GcPtr(\mathcal{A}_{ptr}(\tau)\, L\, R)\, E : \dot{1}$.
By (K-SOME), $\mathcal{A}_{tyarg}(\Delta) \vdash_L \mathcal{A}(\tau : \text{ptr}) : K_R \to \text{int} \to \dot{1}$.

case 2 :$\mathcal{A}(\tau : \text{primitive}) = \lambda R : \text{int}.\lambda E : \text{int}.\mathcal{A}_{prim}(\tau)$
By the $\mathcal{A}_{prim}(\tau)$ case, $\mathcal{A}_{tyarg}(\Delta) \vdash_L \mathcal{A}_{prim}(\tau) :\dot{1}$.
So $\mathcal{A}_{tyarg}(\Delta) \vdash_L \mathcal{A}(\tau : \text{ptr}) : K_R \to \text{int} \to\dot{1}$.

case 3 :$\mathcal{A}_{ptr}(\tau : \text{ptr}) = \mu\alpha : \mathcal{A}_{tyarg}(\text{ptr}).\lambda L : \text{int}.\lambda R : K_R.\lambda E : \text{int}.\lambda I : \text{int}.\cdot\langle \mathcal{A}_0(\tau)\, L\, R\, E\, I,\ GcCoerce\, L\, R\, (\alpha\, L\, R)\rangle$
By induction, $\mathcal{A}_{tyarg}(\Delta) \vdash_L \mathcal{A}_0(\tau : \text{ptr}) : \text{int} \to K_R \to \text{int} \to \text{int} \to\dot{0}$.
By the kinding rules, $\mathcal{A}_{tyarg}(\Delta) \vdash_L \mathcal{A}_{ptr}(\tau) : \text{int} \to K_R \to \text{int} \to \text{int} \to\dot{0}$.

cases 4,5,6: We show several cases for $\mathcal{A}_0(\tau)$ and $\mathcal{A}_{prim}(\tau)$. The proofs for the other cases are similar.

case 4 :
$\mathcal{A}_{prim}((\exists\alpha : K.\tau) : \text{primitive}) = \exists\alpha : \mathcal{A}_{tyarg}(K).\mathcal{A}_{prim}(\tau)$
By induction, $\mathcal{A}_{tyarg}(\Delta, \alpha : K) \vdash_L \mathcal{A}_{prim}(\tau : \text{primitive}) :\dot{1}$.
So $\mathcal{A}_{tyarg}(\Delta), \alpha : \mathcal{A}_{tyarg}(K) \vdash_L \mathcal{A}_{prim}(\tau) :\dot{1}$.
From (K-SOME) rule, $\mathcal{A}_{tyarg}(\Delta) \vdash_L \mathcal{A}_{prim}(\exists\alpha : K.\tau) :\dot{1}$

case 5 :
$\mathcal{A}_{prim}(\alpha : \text{primitive}) = \alpha$
From (KF-TVAR) rule, $\Delta', \alpha : \text{primitive} \vdash_F \alpha : \text{primitive}$
By (K-TVAR) rule, $\mathcal{A}_{tyarg}(\Delta'), \alpha : \mathcal{A}_{tyarg}(\text{primitive}) \vdash_L \alpha : \mathcal{A}_{tyarg}(\text{primitive})$
Thus, $\mathcal{A}_{tyarg}(\Delta', \alpha : \text{primitive}) \vdash_L \alpha :\dot{1}$

case 6 :
$\mathcal{A}_0(\alpha : \text{ptr}) = \alpha$
From (KF-TVAR) rule, $\Delta', \alpha : \text{ptr} \vdash_F \alpha : \text{ptr}$
By (K-TVAR) rule, $\mathcal{A}_{tyarg}(\Delta'), \alpha : \mathcal{A}_{tyarg}(\text{ptr}) \vdash_L \alpha : \mathcal{A}_{tyarg}(\text{ptr})$
Thus, $\mathcal{A}_{tyarg}(\Delta', \alpha : \text{ptr}) \vdash_L \alpha : \text{int} \to K_R \to \text{int} \to \text{int} \to\dot{0}$

2. $\mathcal{A}(x)\, R\, E\, g = x$
By (T-VAR), $\mathcal{A}_{tyarg}(\Delta)$, $R : K_R$, $E : \text{int}; \mathcal{A}(\Gamma)RE$, $\{g : \tau_g(R, E)\}$, $x : \mathcal{A}(\tau)RE \vdash_L x : \mathcal{A}(\tau)RE$
So $\mathcal{A}_{tyarg}(\Delta)$, $R : K_R$, $E : \text{int}; \mathcal{A}(\Gamma, x : \tau)RE$, $\{g : \tau_g(R, E)\} \vdash_L x : \mathcal{A}(\tau)RE$

3. $\mathcal{A}(i)\, R\, E\, g = \text{pack}(i, i)\, \text{as}\, \exists I : \text{int}.Int(I)$
From (TF-INT), $\Delta; \Gamma \vdash_F i : \text{int}$
Becuase by (K-IVAR) $\mathcal{A}_{tyarg}(\Delta)$, $R : K_R$, $E : \text{int}; \mathcal{A}(\Gamma)RE$, $\{g : \tau_g(R, E)\} \vdash_L i : \text{int}$,
by (T-PACK), $\mathcal{A}_{tyarg}(\Delta)$, $R : K_R$, $E : \text{int}; \mathcal{A}(\Gamma)RE$, $\{g : \tau_g(R, E)\} \vdash_L \text{pack}(i, i)\, \text{as}\, \exists I : \text{int}.Int(I) : \exists I : \text{int}.Int(I)$
Thus, $\mathcal{A}_{tyarg}(\Delta)$, $R : K_R$, $E : \text{int}; \mathcal{A}(\Gamma)RE$, $\{g : \tau_g(R, E)\} \vdash_L \mathcal{A}(i)\, R\, E\, g : \mathcal{A}(\text{int})RE$

4. $\mathcal{A}(x_1\, p\, x_2)\, R\, E\, g = OP_p \cdot \langle x_1, x_2\rangle$, $(\Delta'; \Gamma' \vdash_L OP_p : \cdot\langle \tau_{int}, \tau_{int}\rangle \to \tau_{int})$
From (TF-OP) rule, $\Delta; \Gamma \vdash_F x_1 : \text{int}$, and $\Delta; \Gamma \vdash_F x_2 : \text{int}$
By induction, $\mathcal{A}_{tyarg}(\Delta)$, $R : K_R$, $E : \text{int}; \mathcal{A}(\Gamma)RE$, $\{g : \tau_g(R, E)\} \vdash_L x_1 : \tau_{int}$
$\mathcal{A}_{tyarg}(\Delta)$, $R : K_R$, $E : \text{int}; \mathcal{A}(\Gamma)RE$, $\{g : \tau_g(R, E)\} \vdash_L x_2 : \tau_{int}$
Because $\mathcal{A}_{tyarg}(\Delta)$, $R : K_R$, $E : \text{int}; \mathcal{A}(\Gamma)RE$, $\{g : \tau_g(R, E)\} \vdash_L OP_p : \cdot\langle \tau_{int}, \tau_{int}\rangle \to \tau_{int}$
By (T-APP) rule, $\mathcal{A}_{tyarg}(\Delta)$, $R : K_R$, $E : \text{int}; \mathcal{A}(\Gamma)RE$, $\{g : \tau_g(R, E)\} \vdash_L \mathcal{A}(x_1\, p\, x_2)\, R\, E\, g : \tau_{int}$

5. $\mathcal{A}(x[\tau_0])\, R\, E\, g = x[\mathcal{A}_{tyarg}(\tau_0)]$
From (TF-TAPP) rule, we know $\Delta \vdash_F \tau_0 : K$, $\Delta; \Gamma \vdash_F x : \forall[\alpha : K, \overrightarrow{\beta : K'}].(\overrightarrow{\tau}) \to \text{void}$
By induction, $\mathcal{A}_{tyarg}(\Delta)$, $R : K_R$, $E : \text{int} \vdash_L \mathcal{A}_{tyarg}(\tau_0) : \mathcal{A}_{tyarg}(K)$

$\mathcal{A}_{tyarg}(\Delta)$, $R : K_R$, $E : \text{int}; \mathcal{A}(\Gamma)RE$, $\{g : \tau_g(R, E)\} \vdash_L$
$x : \forall\alpha : \mathcal{A}_{tyarg}(K), \overrightarrow{\beta : \mathcal{A}_{tyarg}(K')}.\forall R : K_R.\forall E : \text{int}. \wedge \langle \tau_g(R, E), \overrightarrow{\mathcal{A}(\tau)}\rangle \to \tau_{halt}$
By (T-TAPP) rule, $\mathcal{A}_{tyarg}(\Delta)$, $R : K_R$, $E : \text{int}; \mathcal{A}(\Gamma)RE$, $\{g : \tau_g(R, E)\} \vdash_L$
$x[\mathcal{A}_{tyarg}(\tau_0)] : \overrightarrow{\forall\beta : \mathcal{A}_{tyarg}(K')}.\forall R : K_R.\forall E : \text{int}.(\wedge\langle \tau_g(R, E), \overrightarrow{\mathcal{A}(\tau)}\rangle \to \tau_{halt})[\mathcal{A}_{tyarg}(\tau_0)/\alpha]$
Using Lemma2, $\mathcal{A}_{tyarg}(\Delta)$, $R : K_R$, $E : \text{int}; \mathcal{A}(\Gamma)RE$, $\{g : \tau_g(R, E)\} \vdash_L$
$x[\mathcal{A}_{tyarg}(\tau_0)] : \overrightarrow{\forall\beta : \mathcal{A}_{tyarg}(K')}.\forall R : K_R.\forall E : \text{int}. \wedge \langle \tau_g(R, E), \overrightarrow{\mathcal{A}(\tau[\tau_0/\alpha])}\rangle \to \tau_{halt}$
Thus, $\mathcal{A}_{tyarg}(\Delta)$, $R : K_R$, $E : \text{int}; \mathcal{A}(\Gamma)RE$, $\{g : \tau_g(R, E)\} \vdash_L$
$\mathcal{A}(x[\tau_0])\, R\, E\, g : \mathcal{A}(\forall[\overrightarrow{\beta : K'}].(\overrightarrow{\tau}[\tau_0/\alpha]) \to \text{void})RE$

6.
case 1. $\mathcal{A}(\text{pack}[\tau, x] \text{ as } \exists\beta : K.\tau' : \text{primitive})\, R\, E\, g = \text{pack}\, \mathcal{A}_{tyarg}(\tau), x \text{ as } \exists\beta : \mathcal{A}_{tyarg}(K).\mathcal{A}(\tau')\, R\, E$
From (TF-PACK) rule, $\Delta \vdash_F \tau : K$, $\Delta; \Gamma \vdash_F x : \tau'[\tau/\beta]$
and $\Delta; \Gamma \vdash_F \text{pack}[\tau, x] \text{ as } \exists\beta : K.\tau' : \exists\beta : K.\tau'$
By induction, $\mathcal{A}_{tyarg}(\Delta)$, $R : K_R$, $E : \text{int} \vdash_L \mathcal{A}_{tyarg}(\tau) : \mathcal{A}_{tyarg}(K)$
$\mathcal{A}_{tyarg}(\Delta)$, $R : K_R$, $E : \text{int}; \mathcal{A}(\Gamma)RE$, $\{g : \tau_g(R, E)\} \vdash_L x : \mathcal{A}(\tau'[\tau/\beta])\, R\, E$
using lemma2, we have $\mathcal{A}_{tyarg}(\Delta)$, $R : K_R$, $E : \text{int}; \mathcal{A}(\Gamma)RE$, $\{g : \tau_g(R, E)\} \vdash_L x : \mathcal{A}(\tau')[\mathcal{A}_{tyarg}(\tau)/\beta]\, R\, E$
By (T-PACK) rule, $\mathcal{A}_{tyarg}(\Delta)$, $R : K_R$, $E : \text{int}; \mathcal{A}(\Gamma)RE$, $\{g : \tau_g(R, E)\} \vdash_L$
$\text{pack}\, \mathcal{A}_{tyarg}(\tau), x \text{ as } \exists\beta : \mathcal{A}_{tyarg}(K).\mathcal{A}(\tau')\, R\, E : \exists\beta : \mathcal{A}_{tyarg}(K).\mathcal{A}(\tau')\, R\, E$

case 2. $\mathcal{A}(\text{pack}[\tau, x] \text{ as } \exists\beta : K.\tau' : \text{ptr})\, R\, E\, g = ptr\_pack_K\, R\, E\, (\lambda\beta : \mathcal{A}_{tyarg}(K).\mathcal{A}_{tyarg}(\tau'))\mathcal{A}_{tyarg}(\tau)x$
We already know, $\Delta; \Gamma \vdash_F \text{pack}[\tau, x] \text{ as } \exists\beta : K.\tau' : \text{ptr} : \exists\beta : K.\tau'$
$\Delta; \Gamma \vdash_F x : \tau'[\tau/\beta]$
By induction, $\mathcal{A}_{tyarg}(\Delta)$, $R : K_R$, $E : \text{int} \vdash_L \mathcal{A}_{tyarg}(\tau) : \mathcal{A}_{tyarg}(K)$
$\mathcal{A}_{tyarg}(\Delta)$, $R : K_R$, $E : \text{int}; \mathcal{A}(\Gamma)RE$, $\{g : \tau_g(R, E)\} \vdash_L x : \mathcal{A}(\tau'[\tau/\beta])\, R\, E$
Lemma2 tells us that $(\lambda\beta : \mathcal{A}_{tyarg}(K).\mathcal{A}_{tyarg}(\tau'))\mathcal{A}_{tyarg}(\tau) \equiv \mathcal{A}_{tyarg}(\tau')[\mathcal{A}_{tyarg}(\tau)/\beta] = \mathcal{A}_{tyarg}(\tau'[\tau/\beta]) = \mathcal{A}_0(\tau'[\tau/\beta])$ and $(\lambda\beta : \mathcal{A}_{tyarg}(K).\mathcal{A}_{tyarg}(\tau'))\mathcal{A}_{tyarg}(\gamma) \equiv \mathcal{A}_{tyarg}(\tau')[\mathcal{A}_{tyarg}(\gamma)/\beta] = \mathcal{A}_{tyarg}(\tau'[\gamma/\beta]) = \mathcal{A}_0(\tau'[\gamma/\beta])$.
Using this with the type of ptr_pack_K tells us that $\mathcal{A}_{tyarg}(\Delta)$, $R : K_R$, $E : \text{int}; \mathcal{A}(\Gamma)RE$, $\{g : \tau_g(R, E)\} \vdash_L$
$ptr\_pack_K\, R\, E\, (\lambda\beta : \mathcal{A}_{tyarg}(K).\mathcal{A}_{tyarg}(\tau'))\mathcal{A}_{tyarg}(\tau) : \mathcal{A}(\tau'[\tau/\beta])\, R\, E \to \mathcal{A}(\exists\gamma : K.(\tau'[\gamma/\beta]))\, R\, E$.
From this we conclude $\mathcal{A}_{tyarg}(\Delta)$, $R : K_R$, $E : \text{int}; \mathcal{A}(\Gamma)RE$, $\{g : \tau_g(R, E)\} \vdash_L$
$ptr\_pack_K\, R\, E\, (\lambda\beta : \mathcal{A}_{tyarg}(K).\mathcal{A}_{tyarg}(\tau'))\mathcal{A}_{tyarg}(\tau)x : \mathcal{A}(\exists\gamma : K.(\tau'[\gamma/\beta]))\, R\, E$.
And $\exists\gamma : K.(\tau'[\gamma/\beta]) = \exists\beta : K.\tau'$.

7. $\mathcal{A}(fixcode\, x[\overrightarrow{\alpha : K}](\overrightarrow{x : \tau}).e)\, R\, E\, g = fix\, x : \forall\overrightarrow{\alpha : \mathcal{A}_{tyarg}(K)}.\forall R' : K_R.\forall E' : \text{int}. \wedge \langle \tau_g(R', E'), \overrightarrow{\mathcal{A}(\tau)\, R'\, E'}\rangle \to \tau_{halt}(R')$.
$\Lambda\overrightarrow{\alpha : \mathcal{A}_{tyarg}(K)}.\Lambda R' : K_R.\Lambda E' : \text{int}.\lambda y : \wedge\langle \tau_g(R', E'), \overrightarrow{\mathcal{A}(\tau)\, R'\, E'}\rangle \to \text{let}\, \langle g', \overrightarrow{x}\rangle = y \,\text{in}\, \mathcal{A}(e)\, R'\, E'\, g'$
From (TF-FIX) rule, $\overrightarrow{\alpha : K} \vdash_F \tau_i : K'_i$, $\overrightarrow{\alpha : K}; x : \forall[\overrightarrow{\alpha : K}].(\overrightarrow{\tau}) \to \text{void}, x_1 : \tau_1, \cdots, x_n : \tau_n \vdash_F e$
and $\Delta; \Gamma \vdash_F fixcode\, x[\overrightarrow{\alpha : K}](\overrightarrow{x : \tau}).e : \forall[\overrightarrow{\alpha : K}].(\overrightarrow{\tau}) \to \text{void}$
By induction, $\mathcal{A}_{tyarg}(\overrightarrow{\alpha : K})$, $R' : K_R$, $E' : \text{int} \vdash_L \mathcal{A}(\tau_i)R'E' : 1$
$\mathcal{A}_{tyarg}(\overrightarrow{\alpha : K})$, $R' : K_R$, $E' : \text{int}$; $x : \mathcal{A}(\forall[\overrightarrow{\alpha : K}].(\overrightarrow{\tau}) \to \text{void})R'E'$, $x_1 : \mathcal{A}(\tau_1)R'E'$, $\cdots$, $x_n : \mathcal{A}(\tau_n)R'E'$,
$\{g : \tau_g(R', E')\} \vdash_L \mathcal{A}(e)\, R'\, E'\, g : \tau_{halt}$
by (T-VAR), $y : \wedge\langle \tau_g(R', E'), \overrightarrow{\mathcal{A}(\tau)\, R'\, E'}\rangle \vdash_L y : \wedge\langle \tau_g(R', E'), \overrightarrow{\mathcal{A}(\tau)\, R'\, E'}\rangle$
By (T-LET) rule, $\mathcal{A}_{tyarg}(\overrightarrow{\alpha : K})$, $R' : K_R$, $E' : \text{int}$; $x : \mathcal{A}(\forall[\overrightarrow{\alpha : K}].(\overrightarrow{\tau}) \to \text{void})R'E'$, $y : \wedge\langle \tau_g(R', E'), \overrightarrow{\mathcal{A}(\tau)\, R'\, E'}\rangle \vdash_L$
$\text{let}\, \langle g', \overrightarrow{x}\rangle = y \,\text{in}\, \mathcal{A}(e)\, R\, E'\, g' : \tau_{halt}$
By (T-ABS) rule, we obtain $\mathcal{A}_{tyarg}(\overrightarrow{\alpha : K})$, $R' : K_R$, $E' : \text{int}$; $x : \mathcal{A}(\forall[\overrightarrow{\alpha : K}].(\overrightarrow{\tau}) \to \text{void})R'E' \vdash_L$
$\lambda y : \wedge\langle \tau_g(R', E'), \overrightarrow{\mathcal{A}(\tau)\, R'\, E'}\rangle \to \text{let}\, \langle g', \overrightarrow{x}\rangle = y \,\text{in}\, \mathcal{A}(e)\, R'\, E'\, g' : \wedge\langle \tau_g(R', E'), \overrightarrow{\mathcal{A}(\tau)\, R'\, E'}\rangle \to \tau_{halt}$
Because $\overrightarrow{\alpha : \mathcal{A}_{tyarg}(K)} \vdash_L \overrightarrow{\alpha : \mathcal{A}_{tyarg}(K)}$, $E' : \text{int} \vdash_L E' : \text{int}$, and $R' : K_R \vdash_L R' : K_R$,
by (T-TABS) rule, $\emptyset$; $x : \mathcal{A}(\forall[\overrightarrow{\alpha : K}].(\overrightarrow{\tau}) \to \text{void})R'E' \vdash_L$
$\Lambda\overrightarrow{\alpha : \mathcal{A}_{tyarg}(K)}.\Lambda R' : K_R.\Lambda E' : \text{int}.\lambda y : \wedge\langle \tau_g(R', E'), \overrightarrow{\mathcal{A}(\tau)\, R'\, E'}\rangle \to \text{let}\, \langle g', \overrightarrow{x}\rangle = y \,\text{in}\, \mathcal{A}(e)\, R'\, E'\, g' :$

$\forall\overrightarrow{\alpha : \mathcal{A}_{tyarg}(K)}.\forall R' : K_R.\forall E' : \text{int}. \wedge \langle \tau_g(R', E'), \overrightarrow{\mathcal{A}(\tau)\, R'\, E'}\rangle \rightarrow \tau_{halt}$
By (T-FIX) rule and weakening lemma, $\mathcal{A}_{tyarg}(\Delta)$, $R' : K_R$, $E' : \text{int}; \mathcal{A}(\Gamma)R'E'$, $\{g : \tau_g(R', E')\} \vdash_L$
$\mathcal{A}(fixcode\, x[\overrightarrow{\alpha : K}](\overrightarrow{x : \tau}).e)\, R\, E\, g : \mathcal{A}(\forall[\overrightarrow{\alpha : K}].(\overrightarrow{\tau}) \rightarrow \text{void})R'E'$

8. $\mathcal{A}(x(\overrightarrow{x}))\, R\, E\, g = x\, R\, E \wedge \langle g, \overrightarrow{x}\rangle$
From (TF-APP) rule, $\Delta; \Gamma \vdash_F x_i : \tau_i$, $\Delta; \Gamma \vdash_F x : (\tau_1, \cdots, \tau_n) \rightarrow \text{void}$,
and $\Delta; \Gamma \vdash_F x(\overrightarrow{x})$
By induction, $\mathcal{A}_{tyarg}(\Delta)$, $R : K_R$, $E : \text{int}; \mathcal{A}(\Gamma)RE$, $\{g : \tau_g(R, E)\} \vdash_L x_i : \mathcal{A}(\tau_i)RE$
$\mathcal{A}_{tyarg}(\Delta)$, $R : K_R$, $E : \text{int}; \mathcal{A}(\Gamma)RE$, $\{g : \tau_g(R, E)\} \vdash_L x : \forall R : K_R.\forall E : \text{int}. \wedge \langle \tau_g(R, E), \overrightarrow{\mathcal{A}(\tau)\, R\, E}\rangle \rightarrow \tau_{halt}$
By (T-APP) rule, we get $\mathcal{A}_{tyarg}(\Delta)$, $R : K_R$, $E : \text{int}; \mathcal{A}(\Gamma)RE$, $\{g : \tau_g(R, E)\} \vdash_L x\, R\, E \wedge \langle g, \overrightarrow{x}\rangle : \tau_{halt}$

9. $\mathcal{A}(\text{if0}(x, e_1, e_2))\, R\, E\, g = \text{unpack}\, \beta, x_1 = x\, \text{in}\, \text{if}\, x_1 = 0\, \text{then}\, \mathcal{A}(e_1)\, R\, E\, g\ \text{else}\, \mathcal{A}(e_2)\, R\, E\, g$
From (TF-IF) rule, $\Delta; \Gamma \vdash_F x : \text{int}$, $\Delta; \Gamma \vdash_F e_1$ $\Delta; \Gamma \vdash_F e_2$,
and $\Delta; \Gamma \vdash_F \text{if0}(x, e_1, e_2)$
By induction, $\mathcal{A}_{tyarg}(\Delta)$, $R : K_R$, $E : \text{int}; \mathcal{A}(\Gamma)RE$, $\{g : \tau_g\}RE \vdash_L x : \tau_{int}$
$\mathcal{A}_{tyarg}(\Delta)$, $R : K_R$, $E : \text{int}; \mathcal{A}(\Gamma)RE$, $\{g : \tau_g(R, E)\} \vdash_L \mathcal{A}(e_1)\, R\, E\, g : \tau_{halt}$
$\mathcal{A}_{tyarg}(\Delta)$, $R : K_R$, $E : \text{int}; \mathcal{A}(\Gamma)RE$, $\{g : \tau_g(R, E)\} \vdash_L \mathcal{A}(e_2)\, R\, E\, g : \tau_{halt}$
Because $\mathcal{A}_{tyarg}(\Delta)$, $R : K_R$, $E : \text{int}$, $\beta : \text{int}; \mathcal{A}(\Gamma)RE$, $\{g : \tau_g(R, E)\}$, $x_1 : Int(\beta) \vdash_L (x_1 = 0) : Bool(\beta = 0)$
From (T-IFE) rule , we know
$\mathcal{A}_{tyarg}(\Delta)$, $R : K_R$, $E : \text{int}$, $\beta : \text{int}; \mathcal{A}(\Gamma)RE$, $\{g : \tau_g(R, E)\}$, $x_1 : Int(\beta) \vdash_L \text{if}\, x_1 = 0\, \text{then}\, \mathcal{A}(e_1)\, R\, E\, g\ \text{else}\, \mathcal{A}(e_2)\, R\, E\, g : \tau_{halt}$
By (T-UNPACK) rule, $\mathcal{A}_{tyarg}(\Delta)$, $R : K_R$, $E : \text{int}; \mathcal{A}(\Gamma)RE$, $\{g : \tau_g(R, E)\} \vdash_L \mathcal{A}(\text{if0}(x, e_1, e_2))\, R\, E\, g : \tau_{halt}$

10. $\mathcal{A}(\text{halt}[\tau]x)\, R\, E\, g = halt\, R\, E\, (\mathcal{A}(\tau)\, R\, E) \wedge < g, x >$,
From (TF-HALT) rule, we know $\Delta; \Gamma \vdash_F x : \tau$, and $\Delta; \Gamma \vdash_F \text{halt}[\tau]x$
By induction, $\mathcal{A}_{tyarg}(\Delta)$, $R : K_R$, $E : \text{int}; \mathcal{A}(\Gamma)RE$, $\{g : \tau_g(R, E)\} \vdash_L x : \mathcal{A}(\tau)\, R\, E$
Because $\emptyset; \emptyset; \emptyset; \emptyset; true; \infty \vdash_L halt : \forall R : K_R.\forall E : \text{int}.\forall \alpha :\dot{1}.^\wedge < \tau_g(R, E), \alpha > \rightarrow \tau_{halt}$
By (T-APP) rule, $\mathcal{A}_{tyarg}(\Delta)$, $R : K_R$, $E : \text{int}; \mathcal{A}(\Gamma)RE$, $\{g : \tau_g(R, E)\} \vdash_L halt\, R\, E\, (\mathcal{A}(\tau)\, R\, E) \wedge < g, x > : \tau_{halt}$

11. $\mathcal{A}(\text{let}\, x = t\, \text{in}\, e)\, R\, E\, g = \text{let}\, x = \mathcal{A}(t)\, R\, E\, g\, \text{in}\, \mathcal{A}(e)\, R\, E\, g$
From (TF-SUB) rule, $\Delta; \Gamma \vdash_F t : \tau$, $\Delta; \Gamma, x : \tau \vdash_F e$, and $\Delta; \Gamma \vdash_F \text{let}\, x = t\, \text{in}\, e$
By induction, $\mathcal{A}_{tyarg}(\Delta)$, $R : K_R$, $E : \text{int}; \mathcal{A}(\Gamma)RE$, $\{g : \tau_g(R, E)\} \vdash_L \mathcal{A}(t) : \mathcal{A}(\tau)\, R\, E$
$\mathcal{A}_{tyarg}(\Delta)$, $R : K_R$, $E : \text{int}; \mathcal{A}(\Gamma)RE$, $\{g : \tau_g(R, E)\}$, $x : \mathcal{A}(\tau)\, R\, E \vdash_L \mathcal{A}(e) : \tau_{halt}$
By (T-LET), we get $\mathcal{A}_{tyarg}(\Delta)$, $R : K_R$, $E : \text{int}; \mathcal{A}(\Gamma)RE$, $\{g : \tau_g(R, E)\} \vdash_L \mathcal{A}(\text{let}\, x = t\, \text{in}\, e)\, R\, E\, g : \tau_{halt}$

12. $\mathcal{A}(\text{let}\, x_0 = \pi_i(x_1 : \overrightarrow{\langle \tau : K\rangle})\, \text{in}\, e)\, R\, E\, g = \text{let}\, \langle g', x_0\rangle = obj\_load_{\overrightarrow{K},i}\, R\, E\, \overrightarrow{\mathcal{A}_{tyarg}(\tau)} \wedge \langle g, x_1\rangle\, \text{in}\, \mathcal{A}(e)\, R\, E\, g'$
From (TF-PROJECT), $\Delta; \Gamma \vdash_F x_1 : \langle \tau_1, \cdots, \tau_n\rangle$, $\Delta; \Gamma, x_0 : \tau_i \vdash_F e$,
and $\Delta; \Gamma \vdash_F \text{let}\, x_0 = \pi_i x_1\, \text{in}\, e$
By induction, $\mathcal{A}_{tyarg}(\Delta)$, $R : K_R$, $E : \text{int}; \mathcal{A}(\Gamma)RE$, $\{g : \tau_g(R, E)\} \vdash_L x_1 : \mathcal{A}(\overrightarrow{\langle \tau : K\rangle})\, R\, E$
$\mathcal{A}_{tyarg}(\Delta)$, $R : K_R$, $E : \text{int}; \mathcal{A}(\Gamma)RE$, $\{g' : \tau_g(R, E)\}$, $x_0 : \mathcal{A}(\tau_i)\, R\, E \vdash_L \mathcal{A}(e)\, R\, E\, g' : \tau_{halt}$
Because $\emptyset; \emptyset \vdash_L obj\_load_{\overrightarrow{K},i} : \forall R : K_R.\forall E : \text{int}.\forall \overrightarrow{\alpha : \mathcal{A}_{tyarg}(K)}.\wedge\langle \tau_g(R, E), \mathcal{A}(\overrightarrow{\langle \alpha : K\rangle})\, R\, E\rangle \rightarrow \wedge\langle \tau_g(R, E), \mathcal{A}(\alpha_i : K_i)\, R\, E\rangle$
By (T-APP) rule and lemma2, $\mathcal{A}_{tyarg}(\Delta)$, $R : K_R$, $E : \text{int}; \mathcal{A}(\Gamma)RE$, $\{g : \tau_g(R, E)\} \vdash_L$
$obj\_load_{\overrightarrow{K},i}\, R\, E\, \overrightarrow{\mathcal{A}_{tyarg}(\tau)} \wedge \langle g, x_1\rangle : \wedge\langle \tau_g(R, E), \mathcal{A}(\tau_i : K_i)\, R\, E\rangle$
By (T-LET) rule, $\mathcal{A}_{tyarg}(\Delta)$, $R : K_R$, $E : \text{int}; \mathcal{A}(\Gamma)RE$, $\{g : \tau_g(R, E)\} \vdash_L$

$\mathcal{A}(\text{let } x_0 = \pi_i(x_1 : \langle\overrightarrow{\tau : K}\rangle) \text{ in } e)\, R\, E\, g : \tau_{halt}$

13.

case 1. $\mathcal{A}(\text{let } [\alpha : K, x_0 : \tau_0 : \text{primitive}] = \text{unpack } x_1 : \exists\alpha : K.\tau \text{ in } e)\, R\, E\, g = \text{unpack } \alpha,\ x_0 = x_1 \text{ in } \mathcal{A}(e)\, R\, E\, g$
From (TF-UNPACK) we know $\Delta; \Gamma \vdash_F x_1 : \exists\alpha : K.\tau$, $(\Delta, \alpha : K); (\Gamma, x_0 : \tau) \vdash_F e$,
and $\Delta; \Gamma \vdash_F \text{let } [\alpha, x_0] = \text{unpack } x_1 \text{ in } e$
By induction, $\mathcal{A}_{tyarg}(\Delta)$, $R : K_R$, $E : \text{int}; \mathcal{A}(\Gamma)RE$, $\{g : \tau_g(R, E)\} \vdash_L x_1 : \mathcal{A}(\exists\alpha : K.\tau)\, R\, E$
$\mathcal{A}_{tyarg}(\Delta, \alpha : K)$, $R : K_R$, $E : \text{int}; \mathcal{A}(\Gamma, x_0 : \tau)RE$, $\{g : \tau_g(R, E)\} \vdash_L \mathcal{A}(e)\, R\, E\, g : \tau_{halt}$
Because $\Delta; \Gamma \vdash_F \tau : \text{primitive}$,
$\mathcal{A}_{tyarg}(\Delta)$, $R : K_R$, $E : \text{int}; \mathcal{A}(\Gamma)RE$, $\{g : \tau_g(R, E)\} \vdash_L x_1 : \exists\alpha : \mathcal{A}_{tyarg}(K).\mathcal{A}_{prim}(\tau)$
$\mathcal{A}_{tyarg}(\Delta)$, $\alpha : \mathcal{A}_{tyarg}(K)$, $R : K_R$, $E : \text{int}; \mathcal{A}(\Gamma)RE$, $\{g : \tau_g(R, E)\}$, $x_0 : \mathcal{A}_{prim}(\tau)\, R\, E \vdash_L \mathcal{A}(e)\, R\, E\, g : \tau_{halt}$
By (T-UNPACK) rule,
$\mathcal{A}_{tyarg}(\Delta)$, $R : K_R$, $E : \text{int}; \mathcal{A}(\Gamma)RE$, $\{g : \tau_g(R, E)\} \vdash_L \text{unpack } \alpha,\ x_0 = x_1 \text{ in } \mathcal{A}(e)\, R\, E\, g : \tau_{halt}$

case 2. $\mathcal{A}(\text{let } [\alpha : K, x_0 : \tau_0 : \text{ptr}] = \text{unpack } x_1 : \exists\alpha : K.\tau \text{ in } e)\, R\, E\, g =$
$\text{unpack } \alpha, x_0 = ptr\_unpack_K\, R\, E\, (\lambda\alpha : \mathcal{A}_{tyarg}(K).\mathcal{A}_{tyarg}(\tau))\, x_1 \text{ in } \mathcal{A}(e)\, R\, E\, g$
From (TF-UNPACK) we know $\Delta; \Gamma \vdash_F x_1 : \exists\alpha : K.\tau$, $(\Delta, \alpha : K); (\Gamma, x_0 : \tau) \vdash_F e$,
and $\Delta; \Gamma \vdash_F \text{let } [\alpha, x_0] = \text{unpack } x_1 \text{ in } e$
By induction, $\mathcal{A}_{tyarg}(\Delta)$, $R : K_R$, $E : \text{int}; \mathcal{A}(\Gamma)RE$, $\{g : \tau_g(R, E)\} \vdash_L x_1 : \mathcal{A}(\exists\alpha : K.\tau)\, R\, E$
$\mathcal{A}_{tyarg}(\Delta)$, $\mathcal{A}_{tyarg}(\alpha) : \mathcal{A}_{tyarg}(K)$, $R : K_R$, $E : \text{int}; \mathcal{A}(\Gamma)RE$, $\{g : \tau_g(R, E)\}$, $x_0 : \mathcal{A}(\tau)\, R\, E \vdash_L \mathcal{A}(e)\, R\, E\, g : \tau_{halt}$
From definition we know $\emptyset; \emptyset \vdash_L$
$ptr\_unpack_K : \forall R : K_R.\forall E : \text{int}.\forall\alpha : \mathcal{A}_{tyarg}(K) \to \mathcal{A}_{tyarg}(\text{ptr}).\mathcal{A}(\exists\beta : K.(\alpha\, \beta))\, R\, E \to \exists\beta : \mathcal{A}_{tyarg}(K).(\mathcal{A}(\alpha\, \beta)\, R\, E)$
Lemma2 tells us that $(\lambda\alpha : \mathcal{A}_{tyarg}(K).\mathcal{A}_{tyarg}(\tau))\mathcal{A}_{tyarg}(\alpha) \equiv \mathcal{A}_{tyarg}(\tau)[\alpha/\alpha] = \mathcal{A}_{tyarg}(\tau) = \mathcal{A}_0(\tau)$. Using this with the type of ptr_unpack_K tells us that $\mathcal{A}_{tyarg}(\Delta)$, $R : K_R$, $E : \text{int}; \mathcal{A}(\Gamma)RE$, $\{g : \tau_g(R, E)\} \vdash_L$
$ptr\_unpack_K\, R\, E\, (\lambda\alpha : \mathcal{A}_{tyarg}(K).\mathcal{A}_{tyarg}(\tau)) : \mathcal{A}(\exists\alpha : K.\tau)\, R\, E \to \exists\alpha : \mathcal{A}_{tyarg}(K).(\mathcal{A}(\tau)\, R\, E)$.
Thus, $\mathcal{A}_{tyarg}(\Delta)$, $R : K_R$, $E : \text{int}; \mathcal{A}(\Gamma)RE$, $\{g : \tau_g(R, E)\} \vdash_L$
$ptr\_unpack_K\, R\, E\, (\lambda\alpha : \mathcal{A}_{tyarg}(K).\mathcal{A}_{tyarg}(\tau))\, x_1 : \exists\alpha : \mathcal{A}_{tyarg}(K).(\mathcal{A}(\tau)\, R\, E)$
Because $\mathcal{A}_{tyarg}(\Delta)$, $\mathcal{A}_{tyarg}(\alpha) : \mathcal{A}_{tyarg}(K)$, $R : K_R$, $E : \text{int}; \mathcal{A}(\Gamma)RE$, $\{g : \tau_g(R, E)\}$, $x_0 : \mathcal{A}(\tau)\, R\, E \vdash_L \mathcal{A}(e)\, R\, E\, g : \tau_{halt}$
By (T-UNPACK) rule, $\mathcal{A}_{tyarg}(\Delta)$, $R : K_R$, $E : \text{int}; \mathcal{A}(\Gamma)RE$, $\{g : \tau_g(R, E)\} \vdash_L$
$\text{unpack } \alpha, x_0 = ptr\_unpack_K\, R\, E\, (\lambda\alpha : \mathcal{A}_{tyarg}(K).\mathcal{A}_{tyarg}(\tau))\, x_1 \text{ in } \mathcal{A}(e)\, R\, E\, g : \tau_{halt}$

14. $\mathcal{A}(\text{let } x_0 = \langle\overrightarrow{x : \tau_x}\rangle \text{ in } e)\, R\, E\, g = \text{unpack } E',\ z = alloc_{\overrightarrow{K},n}\, R\, E\, \overrightarrow{\mathcal{A}_{tyarg}(\tau_x)}\, \overrightarrow{\mathcal{A}_{tyarg}(\tau_y)} \wedge \langle g, \overrightarrow{x}, \overrightarrow{y}\rangle \text{ in}$
$\text{let } \langle g', x_0, \overrightarrow{y}\rangle = z \text{ in } \mathcal{A}(e)\, R\, E'\, g'$; where $\{y_1, \cdots, y_n\} = \{y : \tau_y : \text{ptr} \in FV(e)\} - \{x_0\}$
From (TF-VEC) rule, we know $\Delta; \Gamma \vdash_F x_i : \tau_i$, $\Delta; \Gamma, x_0 : \langle\tau_1, \cdots, \tau_n\rangle \vdash_F e$,
$\Delta; \Gamma \vdash_F \text{let } x_0 = \langle\overrightarrow{x}\rangle \text{ in } e$
By induction, we get $\mathcal{A}_{tyarg}(\Delta)$, $R : K_R$, $E : \text{int}; \mathcal{A}(\Gamma)RE$, $\{g : \tau_g(R, E)\} \vdash_L x_i : \mathcal{A}(\tau_i)\, R\, E$,
and $\mathcal{A}_{tyarg}(\Delta)$, $R : K_R$, $E' : \text{int}; \mathcal{A}(\Gamma)RE'$, $\{g' : \tau_g(R, E')\}$, $x_0 : \mathcal{A}(\langle\overrightarrow{\tau_x}\rangle)\, R\, E' \vdash_L \mathcal{A}(e)\, R\, E'\, g' : \tau_{halt}$
From definition, $\emptyset; \emptyset \vdash_L alloc_{\overrightarrow{K},n} : \forall R : K_R.\forall E : \text{int}.\overrightarrow{\forall\alpha : \mathcal{A}_{tyarg}(K)}.\forall\beta_1 : \mathcal{A}_{tyarg}(\text{ptr}).\cdots$
$\forall\beta_n : \mathcal{A}_{tyarg}(\text{ptr}).\wedge\langle\tau_g(R, E), \overrightarrow{\mathcal{A}(\alpha : K)\, R\, E}, \overrightarrow{\mathcal{A}(\beta : \text{ptr})\, R\, E}\rangle \to \exists E'.\wedge\langle\tau_g(R, E'), \mathcal{A}(\overrightarrow{\langle\alpha : K\rangle})\, R\, E', \overrightarrow{\mathcal{A}(\beta : \text{ptr})\, R\, E'}\rangle$
Using lemma2, $\mathcal{A}_{tyarg}(\Delta)$, $R : K_R$, $E : \text{int}; \mathcal{A}(\Gamma)RE$, $\{g : \tau_g(R, E)\} \vdash_L alloc_{\overrightarrow{K},n}\, R\, E\, \overrightarrow{\mathcal{A}_{tyarg}(\tau_x)}\, \overrightarrow{\mathcal{A}_{tyarg}(\tau_y)} \wedge \langle g, \overrightarrow{x}, \overrightarrow{y}\rangle :$
$\exists E'. \wedge \langle\tau_g(R, E'), \mathcal{A}(\langle\overrightarrow{\tau_x}\rangle)\, R\, E', \overrightarrow{\mathcal{A}(\tau_y)\, R\, E'}\rangle$
We know $\mathcal{A}_{tyarg}(\Delta)$, $R : K_R$, $E' : \text{int}; \mathcal{A}(\Gamma)RE'$, $\{g' : \tau_g(R, E')\}$, $x_0 : \mathcal{A}(\langle\overrightarrow{\tau_x}\rangle)\, R\, E' \vdash_L \mathcal{A}(e)\, R\, E'\, g' : \tau_{halt}$.
Say that $\Gamma = \Gamma_{ptr} \cup \Gamma_{ptrextra} \cup \Gamma_{prim}$ where $\Gamma_{ptr}, \Gamma_{ptrextra}, \Gamma_{prim}$ have disjoint domains and:
$\Gamma_{ptr} = \{y_1 \mapsto \tau_{y_1} : \text{ptr}, \ldots, y_n \mapsto \tau_{y_n} : \text{ptr}\}$
$\Gamma_{ptrextra} = \{y'_1 \mapsto \tau_{y'_1} : \text{ptr}, \ldots, y'_{n'} \mapsto \tau_{y'_{n'}} : \text{ptr}\}$
$\Gamma_{prim} = \{z \mapsto \tau_{z_1} : \text{prim}, \ldots, z_m \mapsto \tau_{z_m} : \text{prim}\}$

All free pointer variables in e are in Γ_{ptr}, so no free variables of e appear in $\Gamma_{ptrextra}$. It's easy to show that e typechecks without $\Gamma_{ptrextra}$ (by induction on the typing derivation), and that each free pointer variable y_i in e must appear in Γ (also by induction on the typing derivation):

$\mathcal{A}_{tyarg}(\Delta)$, $R : K_R$, $E' : \text{int}; \mathcal{A}(\Gamma_{ptr} \cup \Gamma_{prim})RE'$, $\{g' : \tau_g(R,\, E')\}$, $x_0 : \mathcal{A}(\langle\overrightarrow{\tau_x}\rangle)\, R\, E' \vdash_L \mathcal{A}(e)\, R\, E'\, g' : \tau_{halt}$.

Then by (T-LET) and (T-VAR):

$\mathcal{A}_{tyarg}(\Delta)$, $R : K_R$, $E' : \text{int}; \mathcal{A}(\Gamma_{prim})RE'$, $z : \wedge\langle\tau_g(R, E'),\, \mathcal{A}(\langle\overrightarrow{\tau_x}\rangle)\, R\, E',\, \overrightarrow{\mathcal{A}(\tau_y)\, R\, E'}\rangle \vdash_L$
$\text{let}\ \langle g', x_0, \overrightarrow{y}\rangle = z\ \text{in}\ \mathcal{A}(e)\, R\, E'\, g' : \tau_{halt}$

For primitive types, $\mathcal{A}(\tau : \text{primitive}) = \lambda R : K_R.\lambda E : \text{int}.\mathcal{A}_{prim}(\tau)$, so $\mathcal{A}(\tau : \text{primitive})\, R\, E' = \mathcal{A}(\tau : \text{primitive})\, R\, E$. This means that $\mathcal{A}(\Gamma_{prim})\, R\, E' = \mathcal{A}(\Gamma_{prim})\, R\, E$, which we can use after weaking the environment with E:

$\mathcal{A}_{tyarg}(\Delta)$, $R : K_R$, $E : \text{int}$, $E' : \text{int}; \mathcal{A}(\Gamma_{prim})RE$, $z : \wedge\langle\tau_g(R, E'),\, \mathcal{A}(\langle\overrightarrow{\tau_x}\rangle)\, R\, E',\, \overrightarrow{\mathcal{A}(\tau_y)\, R\, E'}\rangle \vdash_L$
$\text{let}\ \langle g', x_0, \overrightarrow{y}\rangle = z\ \text{in}\ \mathcal{A}(e)\, R\, E'\, g' : \tau_{halt}$

We can weaken Γ_{prim} to the superset Γ:

$\mathcal{A}_{tyarg}(\Delta)$, $R : K_R$, $E : \text{int}$, $E' : \text{int}; \mathcal{A}(\Gamma)RE$, $z : \wedge\langle\tau_g(R, E'),\, \mathcal{A}(\langle\overrightarrow{\tau_x}\rangle)\, R\, E',\, \overrightarrow{\mathcal{A}(\tau_y)\, R\, E'}\rangle \vdash_L$
$\text{let}\ \langle g', x_0, \overrightarrow{y}\rangle = z\ \text{in}\ \mathcal{A}(e)\, R\, E'\, g' : \tau_{halt}$

By (T-UNPACK), we get

$\mathcal{A}_{tyarg}(\Delta)$, $R : K_R$, $E : \text{int}; \mathcal{A}(\Gamma)RE$, $\{g : \tau_g(R,\, E)\} \vdash_L$
$\text{unpack}\, E',\, z = alloc_{\overrightarrow{K},n} R\, E\, \overrightarrow{\mathcal{A}_{tyarg}(\tau_x)}\, \overrightarrow{\mathcal{A}_{tyarg}(\tau_y)} \wedge \langle g,\, \overrightarrow{x},\, \overrightarrow{y}\rangle\ \text{in let}\ \langle g', x_0, \overrightarrow{y}\rangle = z\ \text{in}\ \mathcal{A}(e)\, R\, E'\, g' : \tau_{halt}$
